

Feedback referring to the likely impacts of an aging Australian population.

To the Chairman Gary, commissioners Helen Owens and Mike Woods.

The Australian population has increased 500% in one hundred years.

Please refer me to the chairman and commissioners into the study on "The likely impact on GDP per capita and the environment of a rapidly decreasing population".

This would focus on the positive aspects (including wealth improvement per capita) over the next 100-500 years of a self regulated decreasing population.

Your study is pre-disposed to focus on the economic SIZE of the state and federal economies.

However this has a very loose (if any) effect on the **GDP per capita, wealth and happiness** of individual Australians.

I am not afraid to support the health maintenance of an ageing population.

What other choice is there ?

To continue increasing the population rapidly forever ?.

This study could be conducted and concluded by kindergarten children.

I see this study as a possible tool for the justification for population increase by people who have a vested interest in the destruction of Australia.

Your sincerely,

Richard van wyk
