Publications enquiries

The Productivity Commission acts as the Secretariat for the Steering Committee for the Review of Government Service Provision. This report and previous editions are available from the Productivity Commission website at www.pc.gov.au.

The Steering Committee welcomes enquiries and suggestions on the information contained in this report. Contact the Secretariat by phone: (03) 9653 2100 or email: gsp@pc.gov.au

Foreword

This year marks the twenty-first edition of the Report on Government Services — comparing the performance of governments in the efficient and effective delivery of a wide range of services aimed at improving the wellbeing of all Australians.

The Report was commissioned in 1993 by Heads of Government (now COAG), with the first report produced in 1995. A new terms of reference issued in 2010 emphasised the dual roles of the Report in improving service delivery, efficiency and performance, and increasing accountability to governments and the public.

Improving the equity and effectiveness of the services included in the Report can affect the community in significant ways. Some services form an important part of the social welfare system (for example, social housing and child protection services), some are provided to people with specific needs (for example, disability services), and others are typically used by each person in the community at some stage during their life (for example, education and training, health services and aged care services).

Improving the efficiency of government services can also have significant economic pay-offs. Governments spent over \$192 billion on the services covered by this Report, representing around 67.9 per cent of total government expenditure, equivalent to about 12 per cent of Australia's gross domestic product.

I commend all governments for their continuing commitment to transparency and accountability. The challenge for the future is to harness this important information source to look at what works to improve service delivery for all Australians.

I would like to thank the Steering Committee for its direction and oversight of this Report, the working group members that provide advice and input, and the Review Secretariat within the Productivity Commission which supports the Steering Committee and working groups and produces the Report.

Peter Harris Chairman January 2016

Terms of Reference

The Report on Government Services

- The Steering Committee will measure and publish annually data on the equity, efficiency and cost effectiveness of government services through the Report on Government Services (ROGS).
- Outputs and objectives
- 2. The ROGS facilitates improved service delivery, efficiency and performance, and accountability to governments and the public by providing a repository of meaningful, balanced, credible, comparative information on the provision of government services, capturing qualitative as well as quantitative change. The Steering Committee will seek to ensure that the performance indicators are administratively simple and cost effective.
- 3. The ROGS should include a robust set of performance indicators, consistent with the principles set out in the Intergovernmental Agreement on Federal Financial Relations; and an emphasis on longitudinal reporting, subject to a program of continual improvement in reporting.
- To encourage improvements in service delivery and effectiveness, ROGS should also highlight improvements and innovation.
- 5. The Steering Committee exercises overall authority within the ROGS reporting process, including determining the coverage of its reporting and the specific performance indicators that will be published, taking into account the scope of National Agreement reporting and avoiding unnecessary data provision burdens for jurisdictions.

Steering Committee authority

- The Steering Committee will implement a program of review and continuous improvement that will allow for changes to the scope of the ROGS over time, including reporting on new service areas and significant service delivery areas that are jurisdiction-specific.
- 7. The Steering Committee will review the ROGS every three years and advise COAG on jurisdictions' compliance with data provision requirements and of potential improvements in data collection. It may also report on other matters, for example, ROGS's scope, relevance and usefulness; and other matters consistent with the Steering Committee's terms of reference and charter of operations.

Reporting to COAG

Attachment tables

Attachment tables are identified in references throughout this sector overview by a 'EA' prefix (for example, table EA.1). A full list of attachment tables is provided at the end of this sector overview, and the attachment tables are available on the website (www.pc.gov.au/rogs/2016).

E.1 Introduction

This sector overview provides an introduction to the Health section of this Report, comprising primary and community health (chapter 10), public hospitals (chapter 11) and mental health management (chapter 12). It provides an overview of the health sector, presenting both contextual information and high level performance information.

Health services are concerned with promoting, restoring and maintaining a healthy society. They involve illness prevention, health promotion, the detection and treatment of illness and injury, and the rehabilitation and palliative care of individuals who experience illness and injury. The health system also includes a range of activities that raise awareness of health issues, thereby reducing the risk and onset of illness and injury.

All abbreviations used in this Report are available in a complete list in volume A: Approach to performance reporting.

Policy context

All levels of government in Australia fund, deliver and regulate health services, with most of the activity performed by the Australian, State and Territory governments. The Australian Government's health services activities include:

- funding State and Territory governments to assist with the cost of providing public hospital and public health services in line with the National Health Reform Agreement and the National Healthcare Agreement (NHA)
- providing rebates to patients and regulating medical services provided by General Practitioners (GPs) and specialists, practice nurses, and some services provided by allied health professionals (such as Medicare), and delivering public health programs
- funding and regulating the Pharmaceutical Benefits Scheme (PBS)
- funding and regulating private health insurance rebates
- funding improved access to primary health care, including Aboriginal and Torres Strait Islander-specific primary health guided by the National Aboriginal and Torres Strait Islander Health Plan and Implementation Plan 2013–2023, specialist services and infrastructure for rural and remote communities
- promulgating and coordinating health regulations
- undertaking health policy research and policy coordination across the Australian, State and Territory governments
- funding hospital services and the provision of other services through the Department of Veterans' Affairs (DVA)
- funding hearing services for eligible Australians through the Australian Government Hearing Services Program
- funding the Medicare Safety Net.

State and Territory governments contribute funding for, and deliver, a range of health care services (including services for Aboriginal and Torres Strait Islander Australians), such as:

- community health services
- mental health services
- specialist palliative care
- public hospital services
- public dental services
- patient transport
- health policy research and policy development
- public health (such as health promotion programs and disease prevention)
- regulation, inspection, licensing and monitoring of premises, institutions and personnel.

Local governments are generally involved in environmental control and a range of community-based and home care services, although the exact nature of their involvement varies across jurisdictions. The non-government sector plays a significant role in the health system, delivering general practice and specialist medical and surgical services, dental services, a range of other allied health services (such as optometry and physiotherapy) and private hospitals.

Sector scope

Health services in Australia are delivered by a variety of government and non-government providers in a range of service settings. This Report primarily concentrates on the performance of primary and community health services (chapter 10), public hospitals (chapter 11) and mental health management (chapter 12). These services are selected for reporting as they:

- make an important contribution to the health of the community
- reflect government priorities, for example, they fall within the National Health Priority

 Areas
- represent significant components of government expenditure on healthcare
- have common objectives across jurisdictions.

High level residential aged care services and patient transport (ambulance) services are not covered in the health chapters in this Report, but are reported separately in chapter 13 ('Aged care services') and chapter 9 ('Fire and ambulance services').

Other major areas of government involvement in health provision not covered in the health chapters, or elsewhere in the Report, include:

- public health programs, other than those for mental health
- funding for specialist medical practitioners other than general practitioners (GPs).

Profile of health sector

Detailed profiles for the services within the health sector are reported in chapters 10, 11 and 12, and cover health service funding and expenditure as well as the size and scope of the individual service types.

Funding

Total recurrent and capital expenditure on health care services in Australia was estimated to be \$154.6 billion in 2013-14 (figure E.1). This total was estimated to account for 9.8 per cent of gross domestic product (GDP) in 2013-14, an increase of 1.0 percentage points from the 8.8 per cent of GDP in 2004-05 (AIHW 2015a). Between 2004-05 and

2013-14, the average annual rate of growth in real expenditure was 4.2 per cent for the Australian Government, 5.3 per cent for State, Territory and local governments, and 5.3 per cent for non-government sources (table EA.1).

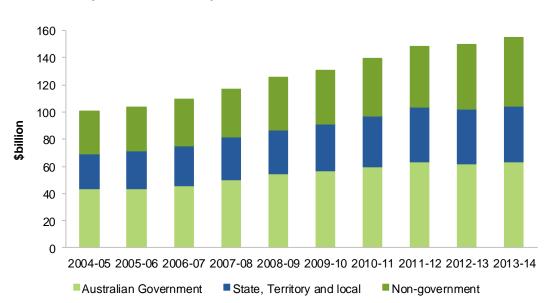

Figure E.1 Total health expenditure, by source of funds (2013-14 dollars)^a

Source: AIHW (Australian Institute of Health and Welfare) (2015) Health Expenditure Australia 2013-14, Health and Welfare Expenditure Series no. 54, Cat. no. HWE 63; table EA.1.

In 2013-14, the combined total health expenditure of the Australian, State and Territory and local governments was \$104.6 billion, representing 67.6 per cent of total health expenditure within Australia (table EA.1). The Australian Government accounted for the largest proportion of health care expenditure — \$63.5 billion or 41.0 per cent. State and Territory, and local governments contributed \$41.1 billion or 26.6 per cent. The remainder was paid by individuals, health insurance funds, workers compensation and compulsory motor vehicle third party insurance providers (tables EA.1–EA.7).

Nationally from 2004-05 to 2013-14:

- total real recurrent health expenditure per person increased from \$4788 to \$6248
- government real recurrent health expenditure per person increased from \$3361 to \$4284
- non-government real recurrent expenditure per person increased from \$1427 to \$1964 (figure E.2 and tables EA.5-EA.6).

^a See table EA.1 for detailed footnotes and caveats.

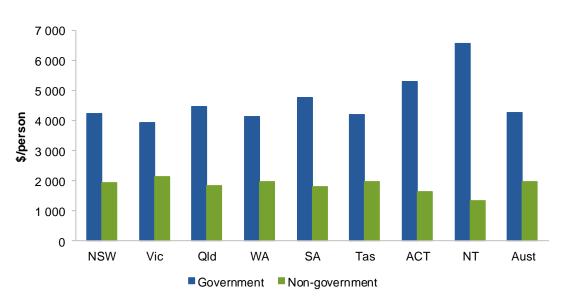

Figure E.2 Recurrent health expenditure per person, by source of funds, 2013-14^a

Source: AIHW (2015) Health Expenditure Australia 2013-14, Health and Welfare Expenditure Series no. 54, Cat. no. HWE 63; table EA.6.

Factors affecting demand for services

Demand for health services is affected by health status, which is in turn affected by a range of demographic and socioeconomic factors. Financial, educational, geographic and cultural barriers can reduce access to health services and contribute to poorer health outcomes.

People who experience social and economic disadvantage have a relatively high risk of negative health outcomes. They are more likely to report their health as fair or poor, to have high rates of health risk factors and to have shorter lives (AIHW 2014a). They also suffer a greater burden-of-disease than do those not experiencing disadvantage (Begg et al. 2007).

Geographic location can affect health status and access to health services. People living in rural and remote areas tend to have higher levels of disease risk factors and poorer health status than those living in major cities (AIHW 2014a). Nationally, 2.3 per cent of the population lived in remote and very remote areas in 2014 (table 2A.12). Those living in remote and very remote areas made up less than 7 per cent of the population in each State and Territory except the NT, where the figure was 42.7 per cent — 20.4 per cent in remote and 22.4 per cent in very remote areas (table 2A.12).

a See table EA.6 for detailed footnotes and caveats.

Indigenous status

Aboriginal and Torres Strait Islander people are more likely than are other Australians to experience poor health, to die at younger ages and to experience disability (AIHW 2014a; tables EA.51 and EA.53). A recent study found socioeconomic disadvantage to be the leading health risk for Aboriginal and Torres Strait Islander Australians in the NT, accounting for 42 to 54 per cent of the life expectancy gap between Aboriginal and Torres Strait Islander and other Australians (Zhao et al. 2013).

Aboriginal and Torres Strait Islander people have low employment and income levels when compared to other Australians (see chapter 2, tables 2A.32–2A.34 and 2A.39–2A.46). Aboriginal and Torres Strait Islander Australians have relatively high rates for many health risk factors and are more likely to smoke and to consume alcohol at risky levels (ABS 2013a, 2014a; Zhao et al. 2013). Aboriginal and Torres Strait Islander Australians are more likely to live in inadequate and overcrowded housing (SCRGSP 2014) and in remote areas with more limited access to health services. In 2006, 51 992 Aboriginal and Torres Strait Islander Australians were living in discrete Aboriginal and Torres Strait Islander communities that were 100 kilometres or more from the nearest hospital (ABS 2007).

Service-sector objectives

Government involvement in health services is predicated on the desire to improve the health of all Australians and to ensure equity of access and the sustainability of the Australian health system. Box E.1 presents nationally agreed objectives of the health system.

Box E.1 Overall objectives of the health system

Government involvement in the health system is aimed at efficiently and effectively improving health outcomes for all Australians and ensuring the sustainability of the Australian health system, achieving the following outcomes:

- Australians are born and remain healthy
- Australians receive appropriate high quality and affordable primary and community health services
- Australians receive appropriate high quality and affordable hospital and hospital related care
- Australians have positive health care experiences which take account of individual circumstances and care needs
- Australians have a health system that promotes social inclusion and reduces disadvantage, especially for Aboriginal and Torres Strait Islander Australians
- · Australians have a sustainable health system.

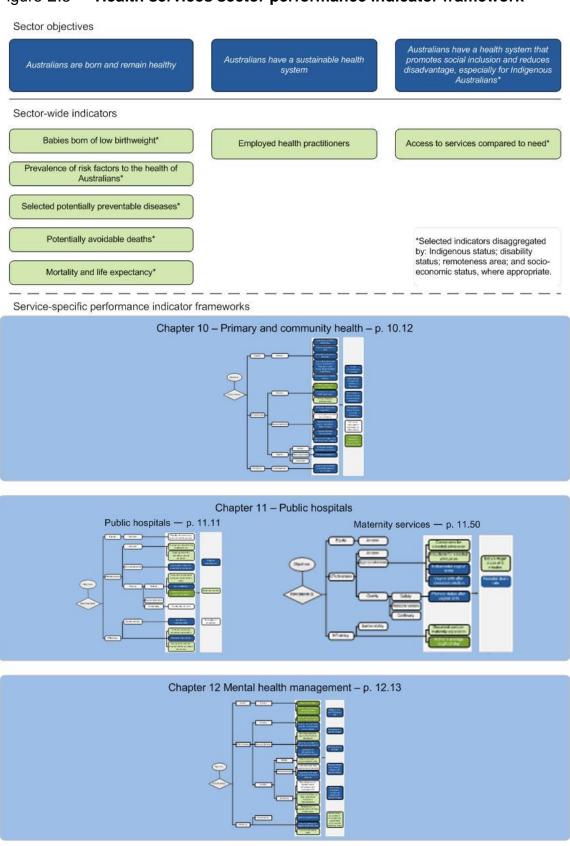

E.2 Sector performance indicator framework

This sector overview is based on a sector performance indicator framework made up of the following elements (figure E.3):

- Sector objectives three sector objectives are a précis of the key objectives of the health system (box E.1)
- Sector-wide indicators seven sector-wide indicators relate to the overarching service sector objectives identified in the NHA
- Information from the service-specific performance indicator frameworks that relate to health services. Discussed in more detail in chapters 10, 11 and 12, the service-specific frameworks provide comprehensive information on the equity, effectiveness and efficiency of these services.

This sector overview provides an overview of relevant performance information. Chapters 10, 11 and 12 and their associated attachment tables provide more detailed information.

Figure E.3 Health services sector performance indicator framework

E.8

Sector-wide performance indicators

This section includes high level indicators of health outcomes. While many factors affect outcomes — not solely the performance of government services — outcomes inform the development of appropriate policies and delivery of government services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Babies born of low birth weight

'Babies born of low birth weight' is an indicator of governments' objective that Australians are born and remain healthy (box E.2). Birthweight is a key indicator of infant health and a principal determinant of a baby's chance of prospective survival, good health, development and wellbeing (AIHW NPESU and AIHW 2013). Low birth weight babies have a greater risk of poor health and dying and are more likely to develop chronic diseases later in life (AIHW 2014b).

Box E.2 Low birth weight of babies

'Low birth weight babies' is defined as the proportion of live singleton babies of low birth weight. Babies' birth weight is defined as low if they weigh less than 2500 grams, very low if they weigh less than 1500 grams and extremely low if they weigh less than 1000 grams (Li et al. 2013).

A low or decreasing number of low birth weight babies is desirable.

Factors external to the health system also have a strong influence on the birth weight of babies. Some factors contributing to low birth weight include socioeconomic status, size of parents, age of mother, number of babies previously born, mother's nutritional status, smoking and alcohol intake, and illness during pregnancy (Li et al. 2013).

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality Information for this indicator is at www.pc.gov.au/rogs/2016.

In 2013, 4.8 per cent of liveborn singleton babies in Australia were of low birth weight (table EA.8). Of all liveborn babies, 1.0 per cent were of very low birth weight (table EA.11). The average birth weight for all live births was 3355 grams in 2013 (table EA.11).

Nationally, rates of live born singleton low birth weight babies increased with remoteness, ranging from 4.7 per cent in major cities to 5.2 per cent in outer regional areas, and 9.5 per cent in very remote areas in 2013 (table EA.13). Rates of live born singleton low birth weight babies in 2013 also increased with relative disadvantage as measured by the Socio Economic Indexes for Areas (SEIFA), ranging from 3.8 per cent for areas in decile 10 — the areas of least relative disadvantage — to 6.7 per cent in decile 1, the areas of greatest relative disadvantage (table EA.13).

Nationally, the average birth weight for liveborn babies of Aboriginal and Torres Strait Islander mothers was 3200 grams in 2013 (table EA.12). Among liveborn singleton babies born to Aboriginal and Torres Strait Islander mothers in the period 2011–2013, the proportion with low birth weight was more than twice that for babies born to non-Indigenous mothers (figure E.4).

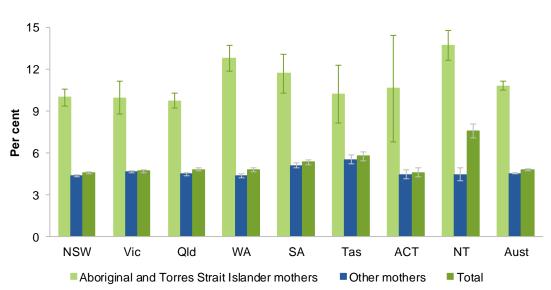

Figure E.4 Proportion of live-born singleton babies of low birth weight, by maternal Indigenous status, 2011–2013^a

Prevalence of risk factors to the health of Australians

'Prevalence of risk factors to the health of Australians' is an indicator of governments' objective that Australians are born and remain healthy (box E.3).

Behaviours that increase the risk of poor health outcomes include lack of exercise, smoking, excessive alcohol consumption, excessive sun exposure and unhealthy dietary habits (AIHW 2014a). Lower risk factor prevalence is associated with improved health outcomes and a reduced burden on the health sector.

^a See box E.2 and table EA.10 for detailed definitions, footnotes and caveats. Source: AIHW (unpublished) National Perinatal Data Collection; table EA.10.

Box E.3 Prevalence of risk factors to the health of Australians

'Prevalence of risk factors to the health of Australians' is defined by the following measures:

Prevalence of overweight and obesity — the proportion of the population with a Body Mass Index (BMI) in the categories of either overweight or obese. BMI is calculated as weight (kg) divided by the square of height (m). BMI values are grouped according to World Health Organization (WHO) and National Health and Medical Research Council (NHMRC) guidelines.

Among adults (defined as people aged 18 years or over), a BMI of 25 to less than 30 is considered overweight and a BMI of 30 or over is considered to be obese (WHO 2000; NHMRC 2013). Children are defined as people aged 5-17 years. For children, obesity is defined as BMI (appropriate for age and sex) that is likely to be 30 or more at age 18 years.

- Rates of current daily smokers the proportion of people aged 18 years or over who smoke tobacco every day.
- Risk of alcohol related harm over a lifetime the proportion of people aged 18 years or over assessed as having an alcohol consumption pattern that puts them at risk of long-term alcohol related harm.

'Lifetime risk of alcohol related harm' is defined according to the 2009 NHMRC guidelines: for males and females, no more than two standard drinks on any day. This has been operationalised as: for both males and females, an average of more than 2 standard drinks per day in the last week.

Rates for all three measures are age standardised.

A low or decreasing rate is desirable for each health risk factor.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2011–13 data are available for all jurisdictions.

The total and non-Indigenous components of the Australian Health Survey (AHS) 2011–2013 did not include people living in discrete Aboriginal and Torres Strait Islander communities, which affects the comparability of the NT results.

Data quality Information for this indicator is at www.pc.gov.au/rogs/2016.

Prevalence of overweight and obesity

Being overweight or obese increases the risk of an individual developing conditions such as heart disease, stroke and type 2 diabetes. In 2011-12, over a third of Australians' measured BMI was in the overweight range and over a quarter were obese (figure E.5; table EA.14).

The percentage of adults who were overweight or obese tended to be higher in remote (70.1 per cent) and outer regional areas (67.8 per cent), than in major cities (60.9 per cent) in 2011-12 (table EA.15). The percentage of people who were overweight or obese increased from 2007-08 in all areas of Australia (table EA.15).

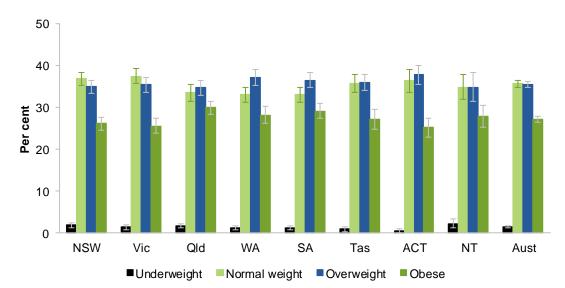

Figure E.5 **Proportion of adults in BMI categories, 2011-12**^a

Source: ABS (Australian Bureau of Statistics) (unpublished) AHS 2011-13 (2011-12 Core component) Cat. no. 4364.0; table EA.14.

The percentage of people who were overweight or obese tended to be higher in older age groups, peaking at age 70–74 for males and females (83.8 per cent and 74.0 per cent respectively) in 2011-12. Overall, the percentage of males and females that were overweight or obese increased from 2007-08 (by 2.1 percentage points for males and 0.9 percentage points for females) although the change varied by age category (table EA.17).

Nationally, the rate of overweight and obesity was higher for Aboriginal and Torres Strait Islander adults (72.4 per cent) than for other adults (62.6 per cent) in 2011–13 (table EA.18). Data for the rate of overweight and obesity for children by Indigenous status are reported in table EA.20.

Rates of current daily smokers

Smoking is an important risk factor for heart disease, stroke and lung cancer (the three leading causes of death in Australia in 2011) (ABS 2014b). The proportion of adult daily smokers aged 18 years or over accounted for 16.3 per cent of the population in 2011-12, a decrease of 2.8 percentage points from 2007-08 (figure E.6 and table EA.21).

Nationally, people from more disadvantaged socioeconomic backgrounds had a higher propensity to smoke (age standardised). In 2011-12, 24.3 per cent of adults living in areas from the first quintile of SEIFA — the areas of greatest relative

a See box E.3 and table EA.14 for detailed definitions, footnotes and caveats.

disadvantage — were daily smokers, compared with 9.0 per cent from the fifth quintile the areas of least relative disadvantage — (figure E.6 and table EA.22).

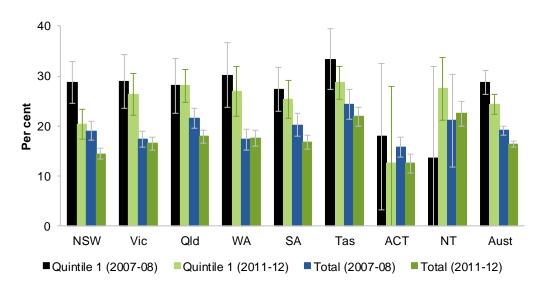

Figure E.6 Proportion of adults who are daily smokers^a

Adults from more remote locations also had a higher propensity to smoke (age standardised) as did Aboriginal and Torres Strait Islander Australians. In 2011-12, daily smokers accounted for 26.1 per cent of the population in remote geographical areas, gradually decreasing as remoteness of residence decreases, accounting for 14.7 per cent in major cities (table EA.21). Nationally, Aboriginal and Torres Strait Islander Australians had higher age-standardised rates of daily smoking (42.0 per cent) than other Australians (16.0 per cent) in 2011–13 (table EA.23).

Levels of risky alcohol consumption

Excessive long-term alcohol consumption increases the risk of heart disease, diabetes, liver cirrhosis and some types of cancers (NHMRC 2009). It can contribute to injury and death through accidents, violence, suicide and homicide, and also to financial problems, family breakdown, and child abuse and neglect (NHMRC 2009).

Across Australia in 2011-12, 19.4 per cent of adults were at risk of long-term alcohol-related harm (although age standardised rates varied among jurisdictions (table EA.24)), and the proportion gradually increased as remoteness of residence increased (figure E.7). There was no statistically significant difference between

^a See box E.3 and table EA.22 for detailed definitions, footnotes and caveats. Source: ABS (unpublished) AHS 2011-13 (2011-12 Core component), Cat. no. 4364.0; ABS (unpublished) National Health Survey 2007-08, Cat. no. 4364.0; table EA.22.

socioeconomic categories in the proportion of Australians at risk of alcohol related harm over a lifetime (table EA.25).

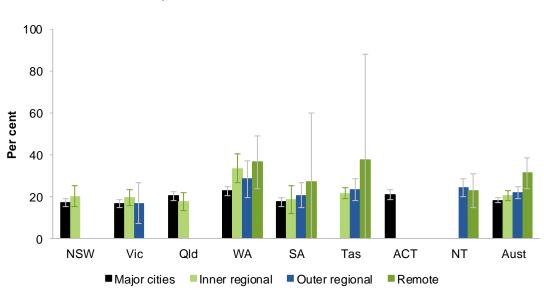

Figure E.7 Adults at risk of alcohol-related harm over a lifetime, by remoteness, 2011-12^{a, b}

Source: ABS (unpublished) AHS 2011-13 (2011-12 NHS (National Health Survey) component); ABS (unpublished) National Health Survey 2007-08; table EA.24.

Nationally, the age standardised proportion of adults at risk of alcohol related harm over a lifetime was similar for Aboriginal and Torres Strait Islander Australians (19.2 per cent) and other Australians (19.5 per cent) in 2011–13, although results varied across jurisdictions (table EA.26).

Selected potentially preventable diseases

'Selected potentially preventable diseases' is an indicator of governments' objective that Australians are born and remain healthy (box E.4). Selected potentially preventable diseases are diseases that can potentially be prevented through reducing health risk factors such as obesity, smoking and harmful drinking.

^a See box E.3 and table EA.24 for detailed definitions, footnotes and caveats. ^b There are no major cities in Tasmania, no outer regional or remote areas in the ACT and no major cities or inner regional areas in the NT.

Box E.4 Selected potentially preventable diseases

'Selected potentially preventable diseases' is defined by the following three measures:

Incidence of selected cancers — incidence of selected cancers of public health importance, expressed as an age standardised rate.

For melanoma, lung and bowel cancer, the measure is defined as the number of new cases in the reported year. For breast and cervical cancer in females, the measure is defined as the number of new cases in women in the reported year

Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions and over time except for NSW and the ACT, for which data for 2011 are estimated
- incomplete for the current reporting period. Data for 2012 are not available for NSW or the ACT.
- Incidence of heart attacks (acute coronary events) the number of deaths recorded as acute coronary heart disease deaths plus the number of non-fatal hospitalisations for acute myocardial infarction or unstable angina not ending in a transfer to another acute hospital, expressed as an age standardised rate.

Data reported for this measure are:

- comparable (subject to caveats) over time at the national level but are not comparable across jurisdictions
- complete for the current reporting period. All required 2013 data are reported for all jurisdictions.
- Prevalence of type 2 diabetes the proportion of people aged 18 years or over recorded as having Type 2 diabetes, expressed as an age standardised rate.

Data reported for this measure are:

- comparable across jurisdictions (subject to caveats) but are not comparable over time
- complete for the current reporting period (subject to caveats). All required 2011–13 data are reported for all jurisdictions.

A low or decreasing rate is desirable for each of the three measures.

Measures of both incidence and prevalence are reported for this indicator. Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population. Prevalence is defined as the proportion of the population suffering from a disorder.

Data quality Information for this indicator is at www.pc.gov.au/rogs/2016.

Incidence of selected cancers

Nationally, the age standardised rate of lung cancer was 43.2 new cases per 100 000 people in 2012. Bowel cancer, which has been linked to diet, occurred at a rate of 57.5 new cases per 100 000 people in 2012 (table EA.28). Other cancers such as melanoma are also largely preventable. The incidence of these cancers for 2012, along with breast and cervical cancer, is presented in figure E.8. Tables EA.29–EA.31 report the incidence of the selected cancers by remoteness, SEIFA IRSD quintiles and Indigenous status.

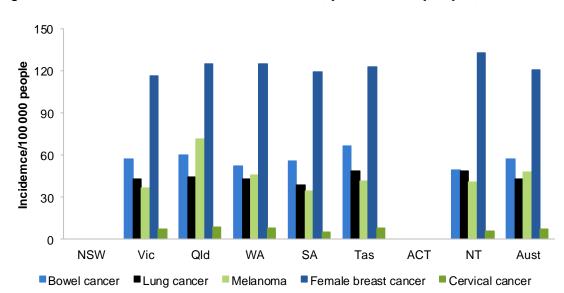

Figure E.8 Incidence of selected cancers, per 100 000 people, 2012a, b

Source: AIHW (unpublished) Australian Cancer Database 2012; ABS (2015) Australian Demographic Statistics, Cat. no. 3101.0; table EA.28.

Data for five-year relative survival proportions for people diagnosed with cancer at the national level are presented in tables EA.47–EA.49.

Incidence of heart attacks (acute coronary events)

Cardiovascular disease is the largest cause of premature death in Australia. Although death rates for cardiovascular disease have declined considerably in recent decades, it continues to be one of the biggest health problems requiring attention in Australia (AIHW 2013a). Nationally, the rate of heart attacks (acute coronary events) was 378.5 new cases per 100 000 people in 2013 (table EA.32). The incidence of heart attacks (acute coronary events) was more than twice as high for Aboriginal and Torres Strait Islander people as for other Australians (table EA.33). Data for states and territories are reported in tables EA.34-EA.41.

Prevalence of type 2 diabetes

People with diabetes are at high risk of serious complications such as cardiovascular, eye and kidney disease. Type 2 diabetes is more common in people who do insufficient physical activity and are overweight or obese, and is largely preventable. Type 2 diabetes accounts for 85-90 per cent of all cases of diabetes (AIHW 2013a). For this reason, data include all newly diagnosed diabetes cases.

^a See box E.4 and table EA.28 for detailed definitions, footnotes and caveats. ^b Data are not available for NSW and the ACT.

Nationally, an estimated 4.3 per cent of people aged 18 years or over had type 2 diabetes in 2011-12 (table EA.42). The prevalence of type 2 diabetes among Aboriginal and Torres Strait Islander adults was around three times higher than for other Australians in the period 2011–13 (tables EA.43-EA.44).

Potentially avoidable deaths

'Potentially avoidable deaths' is an indicator of governments' objective that Australians are born and remain healthy (box E.5).

Box E.5 Potentially avoidable deaths

'Potentially avoidable deaths' is defined as deaths that are potentially avoidable in the context of the present health system. These include deaths from conditions that are potentially preventable through individualised care and/or treatable through existing primary or hospital

A low or decreasing potentially avoidable death rate is desirable.

Most components of the health system can influence potentially avoidable death rates, although there can be decades between the action and the effect. Factors external to the health system also affect potentially avoidable death rates — the health system is in some cases not a factor. For example, while the response of the health system may prevent death following a traffic accident, it is not a factor when a traffic accident causes immediate death.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally, there were 106.9 avoidable deaths per 100 000 people in 2013 (table EA.45). The rate of avoidable deaths for Aboriginal and Torres Strait Islander people was more than three times the rate for other Australians (figure E.9 and table EA.46).

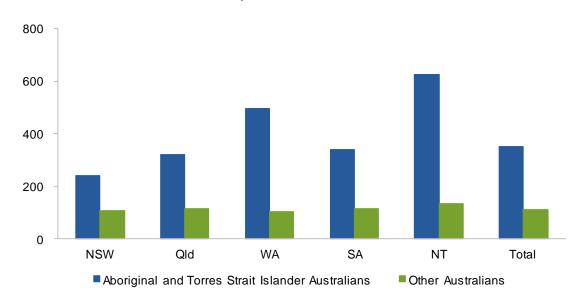

Figure E.9 Age standardised mortality rates for potentially avoidable deaths, under 75 years, 2009-2013a, b

The mortality and life expectancy of Australians

'The mortality and life expectancy of Australians' is an indicator of governments' objective that Australians are born and remain healthy (box E.6). Comparing mortality and life expectancy data across populations, including cause, age, sex, population group and geographical distribution, provide important insights into the overall health of Australians (AIHW 2013b). Trends over time in mortality and life expectancy data can signal changes in the health status of the population, as well as provide a baseline indicator for the effectiveness of the health system.

^a See box E.5 and table EA.46 for detailed definitions, footnotes and caveats. ^b Data are not available for Victoria, Tasmania or the ACT due to the small number of Aboriginal and Torres Strait Islander deaths. Source: ABS (unpublished) Causes of Deaths, Australia, 2013; ABS (unpublished) Estimated Resident Population; ABS (2014) Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, Cat. no. 3238.0; table EA.46.

Box E.6 The mortality and life expectancy of Australians

'The mortality and life expectancy of Australians' is defined by the following three measures:

- Life expectancy the average number of additional years a person of a given age and sex might expect to live if the age-specific death rates of the given period continued throughout his/her lifetime.
- Median age at death the age at which exactly half the deaths registered (or occurring) in a given time period were deaths of people above and below that age.
- Mortality rates the number of registered deaths compared to the total population. Rates are provided for:
 - Australian mortality rate age standardised mortality per 1000 people
 - infant and child mortality rates the number of deaths of children under one year of age registered in a calendar year per 1000 live births registered in the same year (infant mortality rate) and the number of deaths of children under five years in a calendar year per 100 000 children (child mortality rate)
 - mortality rates by major cause of death age standardised mortality per 1000 people, by cause of death.

A high or increasing life expectancy and median age at death are desirable. A low or decreasing mortality rate is desirable.

Most components of the health system can influence the mortality and life expectancy of Australians, although there can be decades between the action and the effect. Factors external to the health system also have a strong influence.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time, except for median age at death
- complete (subject to caveats) for the current reporting period. 2012-2014 data for life expectancy, 2014 data for median age at death, 2014 data for mortality rates and 2013 data for cause of death are available for all jurisdictions.

Data quality Information for this indicator is at www.pc.gov.au/rogs/2016.

Life expectancy

The life expectancy of Australians improved dramatically during the twentieth century and so far during the twenty-first century. The average life expectancy at birth in the period 1901–1910 was 55.2 years for males and 58.8 years for females (ABS 2013b). It has risen steadily in each decade since, reaching 80.3 years for males and 84.4 years for females in 2012–2014 (figure E.10).

Figure E.10 All Australians average life expectancy at birth, 2012–2014a

The life expectancies of Aboriginal and Torres Strait Islander Australians are considerably lower than those of other Australians. ABS estimates are available every 5 years. These indicate a life expectancy at birth of 69.1 years for Aboriginal and Torres Strait Islander males and 73.7 years for Aboriginal and Torres Strait Islander females born from 2010 to 2012. In the same time period, life expectancy at birth for non-Indigenous males was 79.7 years and for non-Indigenous females was 83.1 years (table EA.51).

Median age at death

The median age at death in 2014 was 78.7 years for Australian males and 84.9 years for Australian females (table EA.52).

Comparisons of the median age at death for Aboriginal and Torres Strait Islander and other Australians are affected by different age structures in the populations and by differences in the extent of identification of Aboriginal and Torres Strait Islander deaths across jurisdictions and across age groups. Identification of Aboriginal and Torres Strait Islander status for infant deaths is high, but falls significantly in older age groups. The median age of death for Aboriginal and Torres Strait Islander people is, therefore, likely to be an underestimate.

Nationally, counting only the jurisdictions for which data were available for Aboriginal and Torres Strait Islander Australians, the median age at death for Aboriginal and Torres Strait Islander Australians in 2014 was 55.4 years for males and 61.5 years for females (figure E.11 and table EA.53).

^a See box E.6 and table EA.50 for detailed definitions, footnotes and caveats.

Source: ABS (2015) Life Tables, Australia, States and Territories, 2012-2014, Cat. no. 3302.0.55.001; table EA.50.

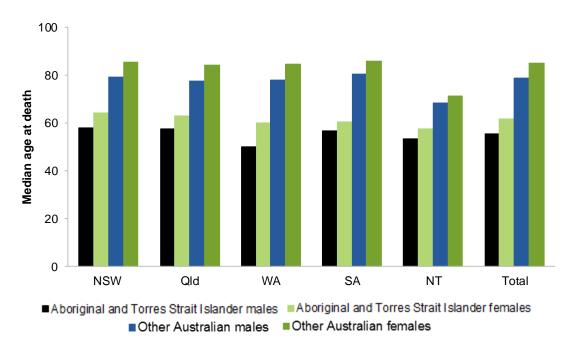

Figure E.11 Median age at death, by sex and Indigenous status, 2014a, b

Mortality rates

The national age standardised mortality rate, measured in deaths per 100 000 people, was 545.0 in 2014 — an increase from 540.0 in 2013 but a decrease from 572.5 in 2010 (figure E.12).

a See box E.6 and table EA.53 for detailed definitions, footnotes and caveats. b Data are not available for Victoria, Tasmania or the ACT due to the small number of Aboriginal and Torres Strait Islander deaths. Source: ABS (2015) Deaths, Australia, 2014, Cat. no. 3302.0; table EA.53.

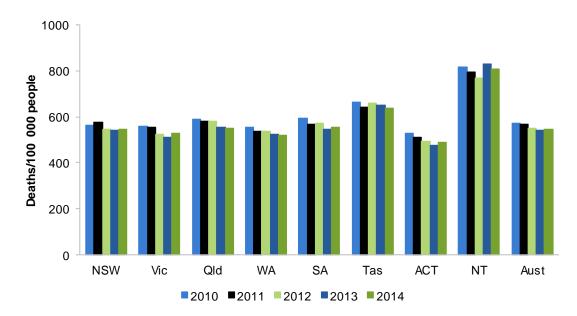

Figure E.12 Mortality rates, age standardised^a

^a See box E.6 and table EA.54 for detailed definitions, footnotes and caveats. Source: ABS (2015) Deaths, Australia, 2014, Cat. no. 3302.0; table EA.54.

Mortality rates — Infant and child

The annual infant mortality rate in Australia declined from an average of 4.9 deaths per 1000 live births in 2005 to 3.4 deaths per 1000 live births in 2014 (table EA.57).

The Australian infant and child combined mortality rate was 82.5 deaths per 100 000 population in 2012–2014 (children aged 0–4 years). Of the total deaths for this age group, 84.0 per cent were infant deaths (table EA.59).

Mortality rates — Aboriginal and Torres Strait Islander Australians

Data for Aboriginal and Torres Strait Islander mortality are collected through State and Territory death registrations. The completeness of identification of Aboriginal and Torres Strait Islander Australian deaths in these collections varies significantly across states and territories so care is required when making comparisons.

For the period 2010–2014, NSW, Queensland, WA, SA and the NT have been assessed as having adequate identification and number of Aboriginal and Torres Strait Islander deaths for mortality analysis. For these five jurisdictions combined, the overall age standardised mortality rate for Aboriginal and Torres Strait Islander people was 985.9 per 100 000 people, significantly higher than for other Australians (581.2 per 100 000 people) (table EA.55). Due to identification completeness issues, mortality rates presented here are likely to be underestimates of the true mortality of Aboriginal and Torres Strait Islander Australians (ABS and AIHW 2008).

For the period 2010-2014, the average mortality rate for Aboriginal and Torres Strait Islander infants (less than one year) was higher than for other infants in the jurisdictions for which there were data available (NSW, Queensland, WA, SA and the NT) (table EA.60). For the same period and the same jurisdictions, the average mortality rate for infants and children combined per 100 000 children aged 0-4 years was 166.0 for Aboriginal and Torres Strait Islander children and 84.1 for other Australian children (table EA.60).

Mortality rates — by major cause of death

The most common causes of death among Australians in 2013 were cancers, diseases of the circulatory system (including heart disease, heart attack and stroke), and diseases of the respiratory system (including influenza, pneumonia and chronic lower respiratory diseases) (tables E.1 and EA.61).

| Table E.1 | Age standardised mortality rates by selected major causes of |
|-----------|--|
| | death (deaths per 100 000 people), 2013 ^a |

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|--|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Neoplasms | 169.4 | 161.9 | 175.6 | 162.0 | 165.6 | 195.3 | 153.8 | 219.4 | 168.2 |
| Diseases of the circulatory system Diseases of the | 159.2 | 143.0 | 160.0 | 143.4 | 151.9 | 186.5 | 123.3 | 185.7 | 153.8 |

| All causes | 543.6 | 512.1 | 554.9 | 522.6 | 547.8 | 649.0 | 474.8 | 831.9 | 540.0 |

a See box E.6 and table EA.61 for detailed detailed definitions, footnotes and caveats. Source: ABS (unpublished) Causes of Death Australia, 2013, Cat. no. 3303.0; table EA.61.

In the jurisdictions for which age standardised death rates are available by Indigenous status (NSW, Queensland, WA, SA and the NT), the leading age-standardised causes of death for Aboriginal and Torres Strait Islander people in the period 2009-2013 were diseases of the circulatory system, cancers, endocrine and other disorders, and diseases of the respiratory system (table EA.62).

Employed health practitioners

'Employed health practitioners' is an indicator of governments' objective that Australians have a sustainable health system (box E.7).

Box E.7 **Employed health practitioners**

'Employed health practitioners' is defined by three measures:

- full time equivalent employed health practitioners divided by the population
- the proportion of full time equivalent employed health practitioners under the age of 45 years
- the average annual growth in full time equivalent employed health practitioners.

Health practitioners data in this Report are for employed medical practitioners and nurses/midwives, with some limited data available for employed allied health professionals.

High or increasing rates for measures of employed health practitioners can give an indication of the sustainability of the health system and its ability to respond and adapt to future needs.

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Information about data quality for this indicator is at www.pc.gov.au/rogs/2016.

In 2014, there were 387.4 (FTE (full time equivalent)) employed medical practitioners per 100 000 people (figure E.13). The majority of employed medical practitioners (commonly referred to as doctors) that were employed in medicine were clinicians (95.3 per cent) and the majority of clinicians were either GPs (33.0 per cent) or specialists (34.9 per cent) (AIHW 2015b).

In 2014, the number of nurses and midwives registered in Australia was 352 838, of whom 300 979 were employed (equating to 1281 per 100 000 population) (table EA.64). The majority of employed nurses and midwives were clinicians (90.1 per cent) (AIHW 2015c). The principal area of the main job of employed registered and enrolled nurses and midwives was aged care (14.4 per cent) followed by medical (9.0 per cent) and surgical (7.9 per cent) roles in 2014 (AIHW 2015c). The number of FTE employed nurses and midwives per 100 000 people by jurisdiction is illustrated for 2011 to 2014 in figure E.14 (data were not collected in 2010).

Nationally there were 435.9 FTE employed allied health practitioners per 100 000 people in 2014 (table EA.65).

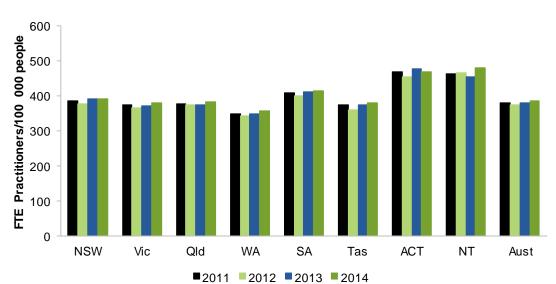

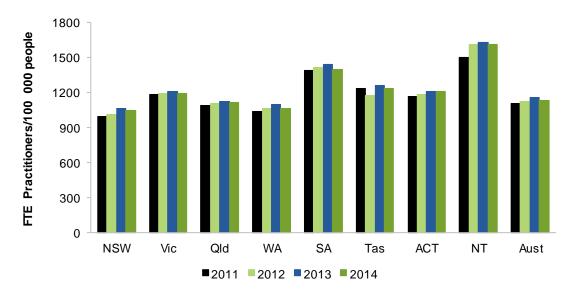

Figure E.13 Full time equivalent employed medical practitioners^a

Full time equivalent employed nurses and midwives^a Figure E.14

At the national level, 52.0 per cent of FTE employed medical practitioners were under the age of 45 in 2014 (table EA.63). The employed medical practitioner workforce grew at an average annual rate of 3.7 per cent from 2009 to 2014 (table EA.66). The employed

^a See box E.7 and table EA.63 for detailed definitions, footnotes and caveats. Source: AIHW (unpublished); table EA.63.

^a See box E.7 and table EA.64 for detailed definitions, footnotes and caveats. Source: AIHW (unpublished); table EA.64.

nursing and midwifery workforce grew at an average annual rate of 2.1 per cent from 2009 to 2014 (table EA.66), and 48.0 per cent of FTE employed nurses were under the age of 45 in 2014 (table EA.64).

Nationally, 1.0 per cent of the employed nursing and midwifery workforce and 0.5 per cent of the employed medical workforce were Aboriginal and Torres Strait Islander in 2014 (table EA.67). Of people employed in health-related occupations in 2011, 1.6 per cent were Aboriginal and Torres Strait Islander. Within health related occupations in 2011, the occupations with the highest percentage of Aboriginal and Torres Strait Islander Australians were health and welfare support officers, which includes the occupation Aboriginal and Torres Strait Islander Health Workers (tables EA.68–EA.70).

Access to services compared to need by type of service

'Access to services compared to need by type of service' is an indicator of governments' objective that Aboriginal and Torres Strait Islander Australians and those living in rural and remote areas or on low incomes achieve health outcomes comparable to the broader population (box E.8).

Box E.8 Access to services compared to need by type of service

'Access to services compared to need by type of service' is defined as the proportion of the population aged 15 years or over who accessed a particular health service in the past 12 months (for hospital admissions), 3 months (for dental services) or 2 weeks (for other health services). Rates are age standardised and calculated separately for each type of service and by categories of self-assessed health status.

Service types are: admitted hospitalisations, casualty/outpatients, GP and/or specialist doctor consultations, consultations with other health professional and dental consultation. Self-assessed health status is categorised as excellent/very good/good and fair/poor. Data are reported for all Australians by remoteness and by SEIFA and for Aboriginal and Torres Strait Islander Australians.

High or increasing rates of 'access to services compared to need by type of service' are desirable, as are rates for those in disadvantaged groups being close to the rates for those who are not disadvantaged.

Data for this measure include 95 per cent confidence intervals (in the form of error bars in figures and percentages in tables).

Data reported for this indicator are

- comparable (subject to caveats) across jurisdictions but not over time
- complete (subject to caveats) for the current reporting period. All required data are available for all jurisdictions for all Australians (2011-12) and Aboriginal and Torres Strait Islander Australians (2012-13).

The total and non-Indigenous components of the AHS 2011-2013 did not include people living in discrete Aboriginal and Torres Strait Islander communities or very remote areas, which affects the comparability of the NT results.

Data quality information for this indicator is under development.

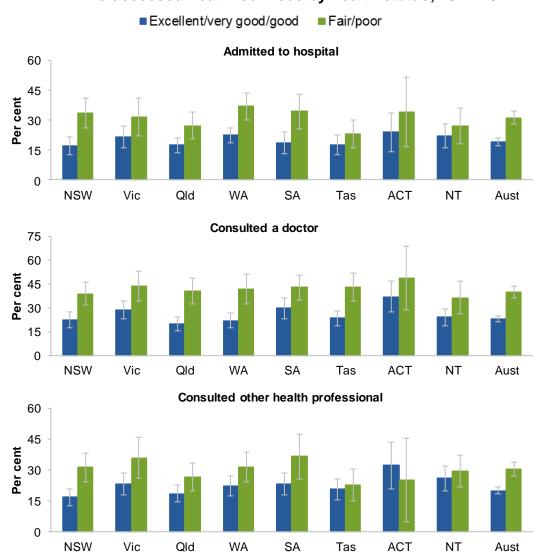

Nationally in 2011-12, the majority of Australians (85.4 per cent) aged 15 years or over reported their health as either good, very good or excellent (ABS 2013c). Aboriginal and Torres Strait Islander people were less likely to report good, very good or excellent health in 2012-13 (76.0 per cent) (ABS 2014a). Age standardised data show that Aboriginal and Torres Strait Islander people were twice as likely as other Australians to report their health as fair or poor.

Health services were accessed in 2011-12 by 27.1 per cent of Australians who reported their health status as excellent/very good/good, and by 48.5 per cent of those who reported their health status as being fair/poor (table EA.71). Data for access to health services by Aboriginal and Torres Strait Islander people are not comparable with data for other Australians due to methodological differences.

Nationally, the proportion of Aboriginal and Torres Strait Islander Australians who accessed services varied significantly by self-assessed health status for hospital admissions, consultations with doctors and consultations with other health professionals (figure E.15). Data for people accessing health services by Indigenous status in 2004-05 are reported in table EA.74.

Data on the proportion of people who accessed health services by remoteness, SEIFA and type of health service are reported for 2004-05 and 2011-12 in tables EA.75–EA.78.

Figure E.15 **Proportion of Aboriginal and Torres Strait Islander people** who accessed health services by health status, 2012-13a

Service-specific performance indicator frameworks

This section summarises information from the following service specific indicator frameworks:

- primary and community health (see chapter 10 for more detail)
- public hospitals (see chapter 11 for more detail)
- maternity services (see chapter 11 for more detail)
- mental health management (see chapter 12 for more detail).

Each performance indicator framework provides comprehensive information on the equity, effectiveness and efficiency of specific government services.

Additional information is available in each chapter and associated attachment tables to assist the interpretation of these results.

Primary and community health

The performance indicator framework for primary and community health is presented in figure E.16. An overview of the primary and community health performance indicator results are presented in table E.2.

Availability of PBS medicines Equity of access to Availability of public Equity Access dentists Early detection and early treatment for Child immunisation Australians Developmental health Objectives childhood diseases Financial barriers to Access Participation PERFORMANCE PBS medicines for women in Public dentistry screening waiting times GPs with vocational Participation for women in Effectiveness screening accreditation Management of Influenza Appropriateness upper respiratory tract infection coverage for older people Jse of pathology tests ind diagnostic imagino Electronic health Safety Quality Patient satisfaction Responsiveness Continuity Cost to government Efficiency Sustainability of general practice per person Key to indicators* Outputs Outcomes Most recent data for all measures are comparable and complete Most recent data for at least one measure are comparable and complete Most recent data for all measures are either not comparable and/or not complete No data reported and/or no measures yet developed (Text)

E.3 Cross cutting and interface issues

The range of determinants affecting Australia's health means that major improvements in health and other life outcomes depend not only on strong partnerships between components of the health system but also on strong relationships between the health sector and other government service sectors. For example:

- Child care, education and training impacts on developmental outcomes and has consequences for overall health and wellbeing throughout life, while poor health has adverse effects on a child's educational development (AIHW 2011)
- Justice services role in providing a safe and secure society and enforcing legislation reduces the risk of injury, while individuals with poor health, including mental illness and illicit drug use, are overrepresented in the justice system (AIHW 2012)
- · Housing and homelessness services impact on environmental risk factors for poor health, while individuals with poor health, including mental illness and illicit drug use, are overrepresented in the homeless population (Garner 2006)
- Community services, such as disability, aged care and child protection services, impact on environmental and social risk factors for poor health, while referrals to such services are often made by health professionals.

E.4 Future directions in performance reporting

The health sector overview will continue to be developed in future reports. National reporting exercises that may inform developments include:

- national clinical quality and safety standards, which are under development by the Australian Commission on Safety and Quality in Health Care
- reporting on the performance of local health networks, hospitals and primary healthcare organisations against the Performance Accountability Framework (currently under review) by the National Health Performance Authority
- biennial reporting on the health of Australians as well as the health system against the National Health Performance Framework (NHPF), in the AIHW's Australia's health. The NHPF is also currently under review
- biennial reporting on the Aboriginal and Torres Strait Islander Health Performance Framework by the Australian Health Ministers' Advisory Council.

The Public hospitals, Primary and community health and Mental health management chapters contain a service specific section on future directions in performance reporting.

E.5 List of attachment tables

Attachment tables are identified in references throughout this appendix by an 'EA' prefix (for example, table EA.1). Attachment tables are available on the website (www.pc.gov.au/rogs/2016).

Table EA.1 Total health expenditure, by broad source of funds (2013-14 dollars) Table EA.2 Government recurrent health expenditure, by area of expenditure (2013-14 Table EA.3 Non-government recurrent health expenditure by area of expenditure (2013-14 dollars) Table EA.4 Recurrent health expenditure, by source of funds and area of expenditure, 2013-14 Table EA.5 Total recurrent health expenditure per person (2013-14 dollars) Table EA.6 Recurrent health expenditure per person by source of funds (2013-14 dollars) Table EA.7 Total health price index and industry-wide indexes (reference year 2013-14 = 100) Table EA.8 Proportion of live-born singleton babies of low birthweight, by Indigenous status of the baby Table EA.9 Proportion of live-born singleton babies of low birthweight, by maternal Indigenous status Table EA.10 Proportion of live-born singleton babies of low birthweight, by maternal Indigenous status, 2011–2013 Table EA.11 Birthweights, live births, all mothers, 2013 Table EA.12 Birthweights, live births, Aboriginal and Torrest Strait Islander mothers, 2013 Table EA.13 Proportion of live-born singleton babies of low birthweight, by remoteness and SEIFA quintiles, and SEIFA deciles, National, 2013 Table EA.14 Proportion of adults and children in BMI categories Table EA.15 Rate of overweight and obesity for adults and children, by remoteness Table EA.16 Rates of overweight and obesity for adults and children, by SEIFA IRSD quinitiles Table EA.17 Rates of overweight and obesity for adults, by sex and age Table EA.18 Rates of overweight and obesity for adults, by Indigenous status, 2011–13 Table EA.19 Rates of overweight and obesity for adults, by Indigenous status, 2004-05 Table EA.20 Rate of overweight and obesity for children by Indigenous status, 2011–13 Table EA.21 Proportion of adults who are daily smokers, by remoteness Table EA.22 Proportion of adults who are daily smokers, by SEIFA IRSD quintiles Table EA.23 Proportion of adults who are daily smokers, by Indigenous status Table EA.24 Proportion of adults at risk of long term harm from alcohol (2009 NHMRC guidelines), by remoteness Table EA.25 Proportion of adults at risk of long term harm from alcohol (2009 NHMRC guidelines), by SEIFA IRSD quintiles Table EA.26 Proportion of adults at risk of long term harm from alcohol (2009 NHMRC guidelines), by Indigenous status Table EA.27 Proportion of adult abstainers from alcohol, by Indigenous status Table EA.28 Incidence of selected cancers Table EA.29 Incidence of selected cancers, by remoteness area, 2012 Table EA.30 Incidence of selected cancers, by SEIFA IRSD guintiles, 2012

⁽a) Constant price health expenditure for 2004-05 to 2013-14 is expressed in terms of 2013-14 prices using a combination of deflators (see table EA.7).

Source: Australian Institute of Health and Welfare (AIHW) 2015, Health Expenditure Australia 2013-14, Health and Welfare Expenditure Series no. 54, Cat. no. HWE 63, Canberra.

⁽b) Data are derived, and include recurrent and capital expenditure.

⁽c) Data exclude expenditure on high level residential aged care.

⁽d) Data include expenditure on ambulance services (reported in chapter 9).

⁽e) Expenditure by Australian Government and non-government sources has been adjusted for tax expenditure in relation to private health incentives claimed through the taxation system.

⁽f) Non-government includes expenditure by individuals, health insurance funds, workers compensation and compulsory motor vehicle third party insurers.

⁽g) Components may not add to totals due to rounding.

⁽h) Derived share of total health expenditure.

| | | Health and | premium | | Territory | Total | insurance | | Total non- | |
| Area of expenditure Un | it DVA | other | rebates (e) | Total | and local | government | funds Individ | duals Other (f) | government | Total |

- (b) Data include funding provided by the Australian Government, State and Territory governments and local government authorities and by the major non-government sources of funding for health care. They do not show total expenditure on health goods and services.
- (c) Data exclude expenditure on high level residential aged care.
- (d) Components may not add to totals due to rounding.
- (e) Includes the 30-40 per cent rebate on health insurance premiums that can be claimed either directly from the Australian Government through the taxation system or it may involve a reduced premium being charged by the private health insurance fund.
- (f) Expenditure on health goods and services by workers compensation and compulsory third-party motor vehicle insurers, as well as other sources of income (for example, rent, interest earned) for service providers.
- (g) Public hospital services exclude certain services undertaken in hospitals. Can include services provided off-site, such as hospital in the home, dialysis or other services.
- (h) 'Other' denotes 'other recurrent health services nec'.
- (i) Data are derived.
 - .. Not applicable. Nil or rounded to zero.

- (a) Constant price health expenditure for 2004-05 to 2013-14 is expressed in terms of 2013-14 prices using a combination of deflators (see table EA.7).
- (b) Data exclude expenditure on high level residential aged care.
- (c) ACT expenditure includes substantial expenditure for NSW residents which may inflate expenditure per person data.

⁽a) Data include funding provided by the Australian Government, State and Territory governments and local government authorities and by the major non-government sources of funding for health care. They do not show total expenditure on health goods and services.

Source: AIHW online health expenditure data cubes (www.aihw.gov.au/expenditure-data/).

⁽b) Constant price health expenditure for 2004-05 to 2013-14 is expressed in terms of 2013-14 prices using a combination of deflators (see table EA.7).

⁽c) Data exclude expenditure on high level residential aged care.

⁽d) ACT expenditure includes substantial expenditure for NSW residents which may inflate expenditure per person data.

| Total (g) | no. | 0.1 | 0.2 | 0.2 | 0.2 | 0.3 | 0.6 | 0.6 | 0.8 | 0.1 |

- (a) Low birthweight is defined as less than 2500 grams.
- (b) Data are for liveborn singletons only and are allocated to State/Territory based on place of usual residence of the mother. Data are not comparable with data reported in tables EA.11-EA.12 which are for all live births and are allocated to State/Territory based on birthplace of the baby.
- (c) Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in WA; and multiple births.
- (d) Indigenous status of the baby is included in the Perinatal NMDS from July 2012. Date of implementation varies across jurisdictions. Caution should be used when interpreting these numbers.
- (e) Data quality information for some data in this table can be found at www.pc.gov.au/rogs/2016.
- (f) Birthweight data on Aboriginal and Torres Strait Islander babies born to mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.
- (g) Includes 42 babies whose Aboriginal and Torres Strait Islander status was not stated.

| Non-Indigenous mothers | no. | 0.1 | 0.2 | 0.2 | 0.2 | 0.3 | 0.6 | 0.6 | 0.8 | 0.1 |
| Total (i) | no. | 0.1 | 0.2 | 0.2 | 0.2 | 0.3 | 0.6 | 0.6 | 0.8 | 0.1 |

- (a) Low birthweight is defined as less than 2500 grams.
- (b) Data do not include babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. The number of babies born to Aboriginal and Torres Strait Islander mothers is not necessarily the total number of Aboriginal and Torres Strait Islander babies born. Data are presented by Indigenous status of the baby for 2013 in table EA.8.
- (c) Data are for liveborn singletons only and are allocated to State/Territory based on place of usual residence of the mother. Data are not comparable with data reported in tables EA.11-EA.12 which are for all live births and are allocated to State/Territory based on birthplace of the baby.
- (d) Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in WA; and multiple births.
- (e) Data exclude Australian non-residents, residents of external territories and where State/Territory of residence was not stated.
- (f) Data quality information for some data in this table can be found at www.pc.gov.au/rogs/2016.
- (g) Data for Victoria for 2012 and previous years are provisional and subject to variation with data quality activities. Further minor changes to the data are not forseen to produce any detectable change to the indicator.
- (h) Birthweight data for babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.
- (i) Includes births to mothers whose Aboriginal and Torres Strait Islander status was not stated.

| Total (h) | no. | 0.1 | 0.1 | 0.1 | 0.1 | 0.2 | 0.3 | 0.3 | 0.5 | |

- (a) Low birthweight is defined as less than 2500 grams.
- (b) Data do not include babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the data do not represent the total number of Aboriginal and Torres Strait Islander babies born in the period 2011–2013. Robust data by Indigenous status of the baby are not available for this period as Indigenous status of the baby was introduced in the Perinatal NMDS in July 2012.
- (c) Data are for liveborn singletons only and are allocated to State/Territory based on place of usual residence of the mother. Data are not comparable with data reported in tables EA.11-EA.12 which are for all live births and are allocated to State/Territory based on birthplace of the baby.
- (d) Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in WA; and multiple births.
- (e) Data exclude Australian non-residents, residents of external territories and where State/Territory of residence was not stated.
- (f) Data quality information for some data in this table can be found at www.pc.gov.au/rogs/2016.
- (g) Birthweight data on babies born to Indigenous mothers residing in the ACT should be viewed with caution as they are based on small numbers of births.
- (h) Includes 131 births to mothers whose Indigenous status was not stated.
 - Nil or rounded to zero.

- (a) Low birthweight is defined as less than 2500 grams.
- (b) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in WA; and multiple births.
- (c) Data excludes Australian non-residents, residents of external territories and where State/Territory of residence was not stated.
- (d) Data quality information for some data in this table can be found at www.pc.gov.au/rogs/2016.
- (e) Disaggregation by remoteness area is by place of usual residence of the mother.
- (f) SEIFA (Socio-Economic Indexes for Areas) deciles are based on the ABS (Australian Bureau of Stastics) IRSD (Index of Relative Socio-economic Disadvantage), with decile 1 being the most disadvantaged and decile 10 being the least disadvantaged. Disaggregation by SEIFA is based on the place of usual residence of the mother.
- (g) Total includes number of babies for which remoteness areas and/or SEIFA categories for the mothers could not be assigned.

Conf. Inter. = 95 per cent confidence interval. **RSE** = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution.

- (a) Adults are defined as persons aged 18 years or over. Children are defined as persons aged 5–17 years.
- (b) Body mass index (BMI) categories for adults are defined as: Underweight (BMI less than 18.5); Normal weight (BMI 18.5–24.9); Overweight (BMI 25.0–29.9); Obese (BMI 30.0 or over).
- (c) BMI catagories for children are defined as BMI (appropriate for age and sex) that is likely to be equal to the BMI for the same adult category at age 18 years.
- (d) Data are calculated from measured height and weight. Data exclude those for whom measured height and weight were not available. Data are not comparable with data for 2004-05 that are based on self-reported height and weight.
- (e) Rates are age standardised by State and Territory, to the 2001 Australian standard population (5 year ranges from 18 years for adults, selected ranges from 5–17 years for children).
- (f) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (g) Data for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (h) Data for the NT for 2011-12 are not comparable with data for previous years due to the increase in sample size.
 - Nil or rounded to zero. **np** Not published.

Conf. Inter. = 95 per cent confidence interval. **RSE** = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.

⁽a) Adults are defined as persons aged 18 years or over. Children are defined as persons aged 5–17 years.

⁽b) Overweight for adults is defined as BMI equal to 25 but less than 30. Overweight for children is defined as BMI (appropriate for age and sex) that is likely to be equal to 25 but less than 30 at age 18 years. Obesity for adults is defined as BMI equal to or greater than 30. Obesity for children is defined as BMI (appropriate for age and sex) that is likely to be 30 or more at age 18 years.

Table EA.15 Rate of overweight and obesity for adults and children, by remoteness (a), (b), (c), (d), (e), (f)

Unit NSW Vic (f) Qld WA SA Tas (f) ACT NT (f), Aust

- (c) Data are calculated from measured height and weight. Data exclude those for whom measured height and weight were not available. Data are not comparable with data for 2004-05 that are based on selfreported height and weight.
- (d) Rates are age standardised by State and Territory, to the 2001 Australian standard population.
- (e) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (f) There are no very remote areas in Victoria; no major cities in Tasmania; no outer regional or remote areas in the ACT; and no inner regional or major cities in the NT.
- (g) Data for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (h) Data for the NT for 2011-12 are not comparable to data for previous years due to the increase in sample size.

Conf. Inter. = 95 per cent confidence interval. **RSE** = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.

- (a) Adults are defined as persons aged 18 years or over. Children are defined as persons aged 5–17 years.
- (b) Overweight for adults is defined as BMI equal to 25 but less than 30. Overweight for children is defined as BMI (appropriate for age and sex) that is likely to be equal to 25 but less than 30 at age 18 years. Obesity for adults is defined as BMI equal to or greater than 30. Obesity for children is defined as BMI (appropriate for age and sex) that is likely to be 30 or more at age 18 years.
- (c) Data are calculated from measured height and weight. Data exclude those for whom measured height and weight were not available. Data are not comparable with data for 2004-05 that are based on selfreported height and weight.

Table EA.16 Rates of overweight and obesity for adults and children, by SEIFA IRSD quinitiles (a), (b), (c), (d), (e), (f)

Unit NSW Vic Qld WA SA Tas ACT NT(g), (h) Aust

- (d) Rates are age standardised by State and Territory, to the 2001 Australian standard population (5 year ranges from 18 for adults, selected ranges from 5–17 for children).
- (e) A lower SEIFA quintile indicates relatively greater disadvantage and a lack of advantage in general. A higher SEIFA quintile indicates a relative lack of disadvantage and greater advantage in general.
- (f) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (g) Data for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (h) Data for the NT for 2011-12 are not comparable to previous years due to the increase in sample size.

RSE = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.

- (a) Adults are defined as persons aged 18 years or over.
- (b) Overweight for adults is defined as BMI equal to 25 but less than 30. Obesity for adults is defined as BMI equal to or greater than 30.
- (c) Data are calculated from measured height and weight. Data exclude those for whom measured height and weight were not available. Data are not comparable with data for 2004-05 that are based on self-reported height and weight.
- (d) Rates for total are age standardised by State and Territory, to the 2001 Australian standard population (5 year ranges from 18 for adults).
- (e) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.

Unit NSW Vic Qld WA SA Tas ACT NT(f), (g) Aust

- (f) Data for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (g) Data for the NT for 2011-12 are not comparable to previous years due to the increase in sample size. **np** Not published.

- (b) Overweight for adults is defined as BMI equal to 25 but less than 30. Obesity for adults is defined as BMI equal to or greater than 30.
- (c) BMI calculated from measured height and weight. Data are not comparable with 2004-05 data that are calculated from self-reported height and weight.
- (d) Rates are age standardised by State and Territory to the 2001 Australian standard population (10 year ranges from 18).
- (e) Data have been revised and are based on the full sample of the Australian Aboriginal and Torres Strait Islander Health Survey. They differ from data published in the 2014 Report (based on a subset of the full sample).
- (f) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (g) Data for non-indigenous people for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (h) Rate ratio is computed by dividing the age standardised rate for Aboriginal and Torres Strait Islander people by the age standardised rate for other Australians.

Conf. Inter. = 95 per cent confidence interval. **RSE** = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.

- (a) Rates for total are age standardised by State and Territory, to the 2001 Australian standard population.
- (b) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (c) There are no very remote areas in Victoria; no major cities in Tasmania; no outer regional or remote areas in the ACT; and no inner regional or major cities in the NT.
- (d) Data were not collected for very remote areas.
- (e) Data for the NT should be used with care as the Australian Health Survey and the National Health Survey excluded very remote areas and discrete Aboriginal and Torres Strait Islander communities. This has a small impact on estimates except for the NT, where more than 20 per cent of the population live in such areas (see DQI for more information).
- (f) Data for 2011-12 for the NT are not comparable to data for previous years due to the increased sample size.

- (a) Adults are defined as persons aged 18 years and over.
- (b) Rates are age standardised by State and Territory to the 2001 Australian standard population (5 year age ranges from 18 years).
- (c) Data for 2011–13 have been revised and are based on the full sample of the Australian Aboriginal and Torres Strait Islander Health Survey. They differ from data published in the 2014 Report (based on a subset of the full sample).
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Data for non-indigenous people for the NT should be interpreted with caution as the Australian Health Survey and the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

Table EA.23 Proportion of adults who are daily smokers, by Indigenous status (a), (b), (c), (d)

Unit NSW Vic Qld WA SA Tas ACT NT (e), (f) Aust

- (f) Data for 2011–13 for other Australians for the NT are not comparable to data for previous years due to the increased sample size.
- (g) Rate ratio is computed by dividing the age standardised rate for Aboriginal and Torres Strait Islander people by the age standardised rate for other Australians.

Conf. Inter. = 95 per cent confidence interval. **RSE** = Relative Standard Error. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.

⁽a) Individuals are defined as at risk of long term harm if they consume more than 2 standard drinks a day (2009 NHMRC alcohol guidelines). Data based on consumption in week before the interview — does not take into account whether consumption in that week was more, less than or the same as usual.

⁽b) Adults are defined as people aged 18 years or over.

Table EA.26 Proportion of adults at risk of long term harm from alcohol (2009 NHMRC guidelines), by Indigenous status (a), (b), (c), (d)

Unit NSW Vic Qld WA SA Tas ACT NT (e), (f) Aust

- (c) Rates are age standardised by State and Territory to the 2001 Australian standard population.
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Data for non-indigenous people for the NT should be interpreted with caution as the Australian Health Survey and the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Data for 2011–13 for other Australians for the NT are not comparable to data for previous years due to the increased sample size.
- (g) Data for 2004-05 are based on the 2009 NHMRC alcohol guidelines and differ from previously reported data that were based on 2001 NHMRC guidelines.
- (h) Rate ratio is computed by dividing the age standardised rate for Aboriginal and Torres Strait Islander people by the age standardised rate for other Australians.

⁽a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.

Table EA.28 Incidence of selected cancers (a), (b), (c)

| Unit NSW (d), (e), (f) | Vic | Qld | WA | SA | Tas | ACT (d), (e), (f) | NT | Aust (f) |
|------------------------|-----|-----|----|----|-----|-------------------|----|----------|
|------------------------|-----|-----|----|----|-----|-------------------|----|----------|

- (b) Due to the low incidence of cancers in some jurisdictions, rates may fluctuate widely from year to year. Comparisons across time and between jurisdictions should be made with caution.
- (c) Data quality information (DQI) for some data in this table is at www.pc.gov.au/rogs/2016.
- (d) Data for NSW and the ACT for 2010 may differ from data estimates published in previous reports. See DQI for more information.
- (e) Data for NSW and the ACT for 2011 are estimated as incidence data are not available. See DQI for more information.
- (f) Data for NSW and the ACT for 2012 are not available and are not included in data for Australia. This constitutes a break in time series for data for Australia between 2011 and 2012. See DQI for more information.
- (g) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 persons.
- (h) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 females.

| Very remote | na | | 3.5 | 9.2 | _ | _ | | np | 4.3 | 4 |

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) Remoteness areas are classified according to the Australian Statistical Geographical Standard (ASGS) Remoteness Area. Disaggregation by remoteness area is based on Statistical Area Level 2 (SA2) of usual residence at time of diagnosis. Not all remoteness areas are represented in all states and territories. The accuracy of these 2011-based classifications decreases over time due to changes in infrastructure within SA2 boundaries since 2011.
- (c) Some remoteness areas in some jurisdictions have small populations. The incidence rates in such areas may fluctuate considerably from year to year due to the behaviour of rare events in small populations.
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Data are not available for NSW or the ACT. Totals do not include NSW or the ACT. See DQI for more information.
- (f) Incidence rates based on counts of 1 to 4 new cases are not published for Tasmania, the ACT or the NT because of statistical unreliability and/or patient confidentiality, consistent with Health Department policies in those jurisdictions.
- (g) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 persons.
- (h) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 females. **na** Not available. .. Not applicable. **–** Nil or rounded to zero. **np** Not published.

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS IRSD, with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. The SEIFA quintiles represent approximately 20 per cent of the national population, but do not necessarily represent 20 per cent of the population in each State or Territory. Disaggregation by SEIFA is based on Statistical Area Level 2 (SA2) of usual residence at time of diagnosis. Not all quintiles are represented in every jurisdiction. SEIFA quintiles are based on 2011 classifications. The accuracy of these classifications decreases over time due to changes in demographics within SA2 boundaries since 2011.
- (c) Some SEIFA quintiles in some jurisdictions have small populations. The incidence rates in such areas may fluctuate considerably from year to year due to the behaviour of rare events in small populations.
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Data are not available for NSW or the ACT. Totals do not include NSW or the ACT. See DQI for more information.
- (f) Incidence rates based on counts of 1 to 4 new cases are not published for Tasmania, the ACT or the NT because of statistical unreliability and/or patient confidentiality, consistent with Health Department policies in those jurisdictions.
- (g) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 persons.
- (h) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 females. **na** Not available. **–** Nil or rounded to zero. **np** Not published.

⁽a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.

Table EA.31

Incidence of selected cancers, by Indigenous status (per 100 000 population) (a), (b), (c), (d), (e)

NSW (f), (g), (h) Vic Qld WA SA Tas (i) ACT (f), (i) NT (i) Total (f),(j) Total (no.) (f),(j)

- (b) The completeness of identification of Aboriginal and Torres Strait Islander people in cancer registry data varies between jurisdictions. Those with sufficiently complete identification to enable reliable reporting of cancer incidence rates are NSW, Victoria (for 2010 and 2012), Queensland, WA and the NT. Data are not published by Indigenous status for the other jurisdictions and are not included in the totals.
- (c) Due to the low incidence of cancers in some jurisdictions, rates may fluctuate widely from year to year. Comparisons across time and between jurisdictions should be made with caution.
- (d) Incidence rates for Aboriginal and Torres Strait Islander people may fluctuate widely from year to year due to the behaviour of rare events in small populations.
- (e) Data quality information (DQI) for some data in this table is at www.pc.gov.au/rogs/2016.
- (f) Data are not available for 2011 or 2012 for NSW and the ACT and are not included in the totals. See DQI for more information.
- (g) Cancer Institute NSW (CINSW) uses an imputation method to impute missing Indigenous status for reporting purposes. Therefore the NSW Indigenous rates reported here may be less than those shown in CINSW reports. See DQI for more information.
- (h) Information on the death certificate is used to supplement the cancer registry's information about Indigenous status. Death certificate data for 2009 were not available for NSW by the time 2009 cancer data were being processed and this may impact on NSW data reported here for 2009.
- (i) Incidence rates based on counts of 1 to 4 new cases are not published for Tasmania, the ACT or the NT because of statistical unreliability and/or patient confidentiality, consistent with Health Department policies in those jurisdictions.
- (j) Totals include only those jurisdictions with sufficiently complete identification of Aboriginal and Torres Strait Islander people with cancer to enable reliable reporting of incidence rates NSW, Victoria (for 2010 and 2012), Queensland, WA and the NT. For 2011 and 2012, totals exclude NSW (see footnote (g)). This constitutes a break in time series totals for 2011 and 2012 are not comparable with totals for previous years.
- (k) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 persons.
- (I) Other Australians includes non-Indigenous people and those for whom Indigenous status was not stated.
- (m) Age-standardised to the 2001 Australian standard population, using five-year age groups to 84 years, and expressed per 100 000 females. **na** Not available. **–** Nil or rounded to zero. **np** Not published.

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) The estimated number of heart attacks (acute coronary events) in a given year is derived from hospitalisations with principal diagnoses of acute myocardial infarction or unstable angina that did not end in a transfer to another acute hospital or death in hospital, plus deaths from acute coronary heart disease.
- (c) Deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions, respectively and are subject to further revision by the ABS.
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Data for Australia are directly age-standardised to the 2001 Australian standard population.

Table EA.33

Incidence of heart attacks (acute coronary events), people 25 years or over, by Indigenous status (per 100 000 people) (a), (b), (c), (d), (f), (g)

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT N | T (h) | Aust (f), (h) |

| Aboriginal and Torres Strait Islander people | rate | na | na | na | na | na | na | na | na | 936.6 |
| Other Australians (h) 2012 | rate | na | na | na | na | na | na | na | na | 425.1 |
| Aboriginal and Torres Strait Islander people | rate | na | na | na | na | na | na | na | na | 994.7 |
| Other Australians (h) 2013 | rate | na | na | na | na | na | na | na | na | 407.6 |
| Aboriginal and Torres Strait Islander people | rate | na | na | na | na | na | na | na | na | 954.8 |
| Other Australians (h) | rate | na | na | na | na | na | na | na | na | 381.8 |

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) The estimated number of heart attacks (acute coronary events) in a given year is derived from hospitalisations with principal diagnoses of acute myocardial infarction or unstable angina that did not end in a transfer to another acute hospital or death in hospital, plus deaths from acute coronary heart disease.
- (c) Data are directly age standardised to the 2001 Australian standard population.
- (d) Deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions, respectively and are subject to further revision by the ABS.
- (f) NMD data from 5 jurisdictions (NSW, Qld, WA, SA and NT) have been assessed by the AIHW as having adequate Indigenous identification from 1998 onwards. The estimates shown in this table for Indigenous and Other Australians are derived using only data from these five jurisdictions because the quality of identification is considered reasonable in both the NHMD and the NMD.
- (g) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.

Table EA.33

Incidence of heart attacks (acute coronary events), people 25 years or over, by Indigenous status (per 100 000 people) (a), (b), (c), (d), (f), (g)

Unit NSW Vic Qld WA SA Tas ACT NT (h) Aust (f), (h)

Source: AIHW unpublished, National Hospital Morbidity Database; AIHW unpublished, National Mortality Database; ABS various years, Australian Demographic Statistics, Cat. no. 3101.0; ABS 2014, Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, Cat. no. 3238.0.

⁽h) Other Australians includes non-Indigenous people and cases where Indigenous status was not stated or inadequately described. For the NT, all non-fatal events treated in the private hospital are included in the incidence counts for other Australians.

Table EA.34 Incidence of heart attacks (acute coronary events), people 25 years or over, NSW (per 100 000 people) (a), (b), (c), (d)

| | NSW | Aust |
|------|-------|-------|
| 2007 | 496.6 | 534.2 |
| 2008 | 466.1 | 501.7 |
| 2009 | 428.2 | 467.2 |
| 2010 | 409.8 | 447.8 |
| 2011 | 379.2 | 427.1 |
| 2012 | 365.7 | 405.9 |
| 2013 | 352.6 | 378.5 |

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) Directly age standardised to the 2001 Australian standard population.
- (c) Comparisons between jurisdictions should not be made as differences in treatment and referral patterns across states/territories are likely to have an impact on administrative records and affect jurisdictional comparability. These data are estimated from national hospital and deaths data. The accuracy of the estimates rely on the accuracy of coding of principal diagnosis, transfers and deaths in hospital in the National Hospital Morbidity Database (NHMD) and the underlying cause of death in the National Mortality Database (NMD). See data quality information at www.pc.gov.au/rogs/2016 for further detail.
- (d) Deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions, respectively and are subject to further revision by the ABS.

Table EA.35 Incidence of heart attacks (acute coronary events), people 25 years or over, Victoria (per 100 000 people) (a), (b), (c), (d)

- (b) Comparisons between jurisdictions should not be made as differences in treatment and referral patterns across states/territories are likely to have an impact on administrative records and affect jurisdictional comparability. These data are estimated from national hospital and deaths data. The accuracy of the estimates rely on the accuracy of coding of principal diagnosis, transfers and deaths in hospital in the National Hospital Morbidity Database (NHMD) and the underlying cause of death in the National Mortality Database (NMD). See data quality information at www.pc.gov.au/rogs/2016 for further detail.
- (d) Deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions, respectively and are subject to further revision by the ABS.

Table EA.41 Incidence of heart attacks (acute coronary events), people 25 years or over, NT (per 100 000 people) (a), (b), (c), (d)

| | NT | Aust |
|------|-------|-------|
| 2007 | 696.4 | 534.2 |
| 2008 | 707.3 | 501.7 |
| 2009 | 767.6 | 467.2 |
| 2010 | 716.8 | 447.8 |
| 2011 | 729.2 | 427.1 |
| 2012 | 647.1 | 405.9 |
| 2013 | 633.5 | 378.5 |

- (a) Incidence is defined as the number of new cases in the reported year and is expressed as a rate of the relevant population.
- (b) Directly age standardised to the 2001 Australian standard population.
- (b) Comparisons between jurisdictions should not be made as differences in treatment and referral patterns across states/territories are likely to have an impact on administrative records and affect jurisdictional comparability. These data are estimated from national hospital and deaths data. The accuracy of the estimates rely on the accuracy of coding of principal diagnosis, transfers and deaths in hospital in the National Hospital Morbidity Database (NHMD) and the underlying cause of death in the National Mortality Database (NMD). See data quality information at www.pc.gov.au/rogs/2016 for further detail.
- (d) Deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions, respectively and are subject to further revision by the ABS.

REPORT ON GOVERNMENT SERVICES 2016 HEALTH SECTOR OVERVIEW PAGE 1 of TABLE EA.42

Table EA.42 Proportion of people with type 2 diabetes (based on fasting blood glucose test), by sex, 2011-12 (per cent) (a), (b), (c), (d), (e)

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT | NT (f) | Aust |
|-------------------|-------|------|------|------|------|------|------|------|--------|------|
| Relative standard | error | | | | | | | | | |
| Males | % | 17.6 | 24.0 | 16.4 | 16.3 | 17.8 | 16.4 | 27.3 | 30.4 | 8.5 |
| Females | % | 18.9 | 37.4 | 20.1 | 22.0 | 19.2 | 20.0 | 24.1 | 49.4 | 10.7 |
| Total (g) | % | 13.0 | 18.4 | 12.8 | 13.6 | 12.3 | 13.0 | 19.3 | 21.2 | 6.4 |

RSE = Relative Standard Error. Estimates with RSEs between 25 percent and 50 per cent should be used with caution.

- (a) Data include pregnant women.
- (b) Data include those with known type 2 diabetes and all persons with newly diagnosed diabetes. Diabetes prevalence is derived using a combination of fasting plasma glucose test results and self-reported information on diabetes diagnosis and medication use. The type of diabetes for newly diagnosed cases cannot be determined from a fasting plasma glucose test alone. However, as it is assumed that the vast majority of newly diagnosed cases would be Type 2, all newly diagnosed cases of diabetes have been included in this measure. See data quality information (DQI) for more information.
- (c) Fasting plasma glucose is a fasting blood test. Data include only people who fasted for 8 hours or more prior to their blood test. For Australia in 2011-12, approximately 79 per cent of people aged 18 years or over and people aged 25 years or over who participated in the National Health Measures Survey (NHMS) had fasted.
- (d) Rates are age standardised to the 2001 Australian standard population using 5 year ranges from 18 years.
- (e) DQI for some data in this table is at www.pc.gov.au/rogs/2016.
- (f) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (g) Denominator includes a small number of persons for whom test results were not reported.

⁽a) Age-standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 1000 or 100 000 persons. SDRs in this table have been calculated using the direct method, agestandardised by 5 year age groups to less than 75 years.

⁽b) Data based on reference year. See data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.

⁽c) Potentially avoidable deaths refer to deaths from certain conditions that are considered avoidable given timely and effective health care. Avoidable mortality measures premature deaths (for those aged 0–years) for specific conditions defined and agreed to nationally by NHISSC and endorsed by NHIPPC (August 2014). These include external events in which the health system has no role — for example, while the response of the health system may prevent death following an accidental fall, it is not a factor when an accidental fall causes immediate death.

Table EA.45 Age-standardised mortality rates of potentially avoidable deaths, under 75 years (a), (b), (c), (d), (e), (f)

NSW Vic Qld WA SA Tas ACT NT Aust (g) (h)

- (d) Causes of death data are subject to a two-year revisions process. Data for 2007 to 2011 are final; data for 2012 are revised and subject to further revision; data for 2013 are preliminary and subject to revision. See Causes of Death, Australia, 2013 (Cat. no. 3303.0) Technical Note: Causes of Death Revisions 2011 and 2012 for further information.
- (e) Historical data may differ from previous reports as a nationally agreed revisions to the definition of potentially avoidable deaths in 2014 have been applied. See DQI for more information.
- (f) Some totals and figures may not compute due to the effects of rounding.
- (g) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See DQI for further information.
- (h) All states and territories including other territories.

| Rate (a) | per 100 000 | 239.5 | 320.5 | 494.6 | 338.7 | 623.9 | 350.5 |
| Other Australians (i) | | | | | | | |
| Number of deaths | no. | 39 146 | 25 010 | 11 355 | 9 670 | 949 | 86 130 |
| Rate (a) | per 100 000 | 107.6 | 115.1 | 101.9 | 112.8 | 134.4 | 109.7 |

- (a) Age-standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 1000 or 100 000 persons. SDRs in this table have been calculated using the direct method, agestandardised by 5 year age groups to less than 75 years.
- (b) Potentially avoidable deaths refer to deaths from certain conditions that are considered avoidable given timely and effective health care. Avoidable mortality measures premature deaths (for those aged 0-74 years) for specific conditions defined and agreed to nationally by NHISSC and endorsed by NHIPPC (August 2014). These include external events in which the health system has no role — for example, while the response of the health system may prevent death following an accidental fall, it is not a factor when an accidental fall causes immediate death.
- (c) Historical data may differ from previous reports as a nationally agreed revisions to the definition of potentially avoidable deaths in 2014 have been applied. data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.
- (d) Non-Indigenous estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. Non-Indigenous population estimates have been derived for these data by subtracting the 2011 Census-based Indigenous population projections from the 2011 Census based total persons estimated resident population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.
- (e) Based on year of registration of death (also called 'reference year'). See DQI for further information.
- (f) Some totals and figures may not compute due to the effects of rounding.
- (g) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (h) Data are reported by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. Only these five states and territories have evidence of a sufficient level of Indigenous identification and sufficient numbers of Indigenous deaths to support mortality analysis.

Age standardised mortality rates of potentially avoidable deaths, under 75 years, by Indigenous status, NSW, Queensland, WA, SA, NT (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)

Unit NSW Qld (k) WA (l) SA NT Total (m)

- (i) Causes of death data are subject to a two-year revisions process. Data for 2007 to 2011 are final; data for 2012 are revised and subject to further revision; data for 2013 are preliminary and subject to revision. See Causes of Death, Australia, 2012 (Cat. no. 3303.0) Technical Note: Causes of Death Revisions 2010 and 2011 for further information.
- (j) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (k) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See DQI for further information.
- (I) For WA, Indigenous deaths data for 2007, 2008 and 2009 have been corrected. The data differ from previous reports in which they were over-reported. Please see DQI for more information.
- (m) Total includes data for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

| Quintile 3 | na | na |
| Quintile 4 | na | na |
| Quintile 5 | na | na |

⁽a) Excludes basal cell and squamous cell carcinomas of the skin because these are not mandated for collection.

na Not available.

Sources: AIHW (unpublished) 2011 Australian Cancer Database; AIHW (unpublished) National Death Index.

⁽b) Survival was calculated with the period method using the period 2007–2011. Note that this period does not contain incidence data for 2010–2011 for NSW or the ACT as these data were not available.

Table EA.48 Five-year relative survival proportions for people diagnosed with cancer (relative rate), by sex, remoteness and SEIFA quintiles, 2006–2010 (a)

| | nor cont | variability band (per cent) |
|-------------------------|----------|-------------------------------|
| | per cent | variability barid (per certi) |
| Sex | | |
| Males | 65.0 | 64.7–65.2 |
| Females | 67.2 | 66.9–67.5 |
| Remoteness of residence | | |
| Major cities | 66.3 | 66.1–66.5 |
| Inner regional | 65.7 | 65.3–66.1 |
| Outer regional | 64.6 | 64.0–65.2 |
| Remote and Very remote | 62.3 | 60.7–63.8 |
| SEIFA of residence (b) | | |
| Quintile 1 | 62.8 | 62.4–63.2 |
| Quintile 2 | 64.2 | 63.8–64.6 |
| Quintile 3 | 65.4 | 65.0–65.9 |
| Quintile 4 | 67.1 | 66.7–67.5 |
| Quintile 5 | 70.5 | 70.1–70.9 |

- (a) Excluding basal cell and squamous cell carcinoma of the skin which are not mandated for collection. Cancer cases diagnosed up to and including 2007 were followed for deaths (from any cause) to 31 December 2010.
- (b) SEIFA quintiles are based on the SEIFA IRSD, with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. The SEIFA quintiles represent approximately 20 per cent of the national population, but do not necessarily represent 20 per cent of the population in each State or Territory. SEIFA quintiles are based on 2006 classifications. The accuracy of these classifications decreases over time due to changes in demographics within postcode boundaries since 2006. Not all quintiles are represented in every jurisdiction.

⁽a) Estimates of life expectancy for Aboriginal and Torres Strait Islander people are not available for Victoria, SA, Tasmania or the ACT as the number of Aboriginal and Torres Strait Islander deaths in these jurisdictions is too small to support valid estimation.

Estimated life expectancies at birth, by Indigenous status and sex (years) (a), (b), (c), (d)

| | | | | Australia — for | Australia — |
|-----|-----|----|----|-----------------|--------------------|
| | | | | comparison | Headline estimates |
| NSW | Qld | WA | NT | (e), (f) | (e), (g) |

- (b) Care should be taken in comparing life expectancy data by Indigenous status over time as Indigenous status is determined by self-identification and can vary from one Census to another.
- (c) Life tables are constructed separately for males and females. Life expectancy estimates for Persons are a weighted combination of male and female life expectancies.
- (d) Data quality information for some data in this table is at www.pc.gov.au/rogs/2016.
- (e) Australian totals include all states and territories (including 'other territories').
- (f) These estimates, calculated without an age-adjustment, are not the headline estimates for Australia but are provided to enable effective comparison with the state and territory estimates.
- (g) Headline estimates for Australia for 2010–2012 are calculated using an improved methodology (taking into account age-specific identification rates) that could not be applied at state/territory level. Therefore, these data should not be compared with data for any State or Territory. The statistical impact of the improved methodology as well as the improved collection of Indigenous status in the 2011 Post Enumeration Survey were also applied to provide 'Headline estimates' for Australia for 2005--2007 data, to enable comparison over time.
- (h) Differences are based on unrounded estimates.

REPORT ON GOVERNMENT SERVICES 2016 HEALTH SECTOR OVERVIEW PAGE 1 of TABLE EA.53

Table EA.53 Median age at death, by Indigenous status (years) (a), (b), (c), (d)

| | | | | | | | | | Total |
|------|------|---------|------|------|------|---------|---------|------|----------|
| | NSW | Vic (e) | Qld | WA | SA | Tas (e) | ACT (e) | NT | (e), (f) |
| 2010 | 84.3 | np | 83.9 | 84.2 | 84.9 | np | np | 75.2 | 84.3 |
| 2011 | 84.7 | np | 84.2 | 84.4 | 85.3 | np | np | 73.5 | 84.6 |
| 2012 | 84.9 | np | 84.2 | 84.4 | 85.6 | np | np | 74.0 | 84.7 |
| 2013 | 85.0 | np | 83.9 | 84.2 | 85.5 | np | np | 71.4 | 84.7 |
| 2014 | 85.3 | np | 84.4 | 84.5 | 85.8 | np | np | 71.3 | 85.0 |

- (a) Median age at death does not adjust for the age structure of the populations involved.
- (b) Based on year of registration of death (also called 'reference year').
- (c) Excludes deaths not identified as Aboriginal and Torres Strait Islander people or other Australians. As a result, deaths may be underestimated for both populations.
- (d) Care should be exercised when comparing median age at death between Aboriginal and Torres Strait Islander and other Australians. For example, a lower median age at death can result from better identification of Aboriginal and Torres Strait Islander people for infant deaths than for older age groups.
- (e) Data are not available for Victoria, Tasmania and the ACT due to the small number of Aboriginal and Torres Strait Islander deaths in these jurisdictions.
- (f) Figures for Australia include 'Other Territories'.

np Not published.

⁽a) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 standard population. SDRs in this table have been calculated using the direct method, age standardised by 5 year age groups to 85 years or over. Rates calculated using the direct method are not comparable to rates calculated using the indirect method.

⁽b) Rates may differ from previous Report editions as population estimates are revised based on the 2011 Census.

Table EA.54 Age standardised mortality rate (all causes), by State and Territory (a), (b), (c), (d)

| | Unit | NSW | Vic | <i>Qld</i> (d) | WA | SA | Tas | ACT | NT | Aust (e) (f) |
|------|------|-----|-----|----------------|----|----|-----|-----|----|--------------|
| | | | | | | | | | | |

- (c) Data based on year of registration of death (also called 'reference year'). See data quality information (DQI) for more detail.
- (d) Age at death unknown has been prorated across all age groups.
- (d) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See DQI for further information.
- (e) Includes Other Territories.
- (f) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. See DQI for more information.

| Rate per 100 000 persons | rate | 584.2 | 582.9 | 542.4 | 606.6 | 593.1 | 581.2 |
| Variability bands (m) | <u>+</u> | 5.2 | 7.0 | 9.5 | 10.6 | 56.7 | 3.6 |
| Rate ratio (n) | no. | 1.4 | 1.6 | 2.3 | 1.4 | 2.5 | 1.7 |

- (a) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 standard population. SDRs in this table have been calculated using the direct method, age standardised by 5 year age groups to 75 years and over. Rates calculated using the direct method.
- (b) Although most deaths are registered, it is likely that some are not accurately identified as of Aboriginal and Torres Strait Islander people. Therefore, data are likely to underestimate the mortality rate for Aboriginal and Torres Strait Islander people.
- (c) Data are reported individually by jurisdiction of usual residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification for Aboriginal and Torres Strait Islander people and sufficient numbers of deaths to support mortality analysis.
- (d) Data based on year of registration of death (also called 'reference year').
- (e) Data are presented in five-year groupings due to volatility of the small numbers involved.
- (f) Rates are derived using population estimates and projections based on the 2011 Census. Non-Indigenous population estimates are available for Census years only. In the intervening years, non-Indigenous rates are derived using Aboriginal and Torres Strait Islander population estimates and projections derived from assumptions about past and future levels of fertility, mortality and migration subtracted from the total ERP to provide non-Indigenous population estimates. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base Census year of the projection series increases. ERPs used from 2012 onwards are first release preliminary estimates. See DQI for further information.
- (g) Age at death unknown has been prorated across all age groups.
- (h) Excludes deaths where Indigenous status is recorded as 'not stated'.
- (i) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. See DQI for more information.

Age standardised all-cause mortality rate and rate ratios, by Indigenous status, NSW, Qld, WA, SA, NT, five year aggregate, 2010–2014 (per 100 000 people) (a), (b), (c), (d), (e), (f), (g), (h), (i)

Unit NSW Qld (j) WA SA NT Total (k), (l)

- (j) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See DQI for further information.
- (k) Some totals and figures may not compute due to the effects of using different denominators and of rounding.
- (I) Total includes data for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (m) Variability bands can be be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals. See DQI for further information.
- (n) Rate ratio is the age standardised rate for Aboriginal and Torres Strait Islander people divided by the non-Indigenous rate.

| Rate per 1000 live births | 3.9 | 3.3 | 5.4 | 3.6 | 3.8 | 4.1 | 3.7 | 7.2 | 4.1 |
| 2011 | | | | | | | | | |
| Number of deaths | 372 | 251 | 294 | 96 | 52 | 30 | 15 | 30 | 1 140 |
| Rate per 1000 live births | 3.8 | 3.5 | 4.6 | 3.0 | 2.6 | 4.5 | 2.9 | 7.6 | 3.8 |
| 2012 | | | | | | | | | |
| Number of deaths | 312 | 219 | 281 | 83 | 65 | 22 | 16 | 33 | 1 031 |
| Rate per 1000 live births | 3.2 | 2.8 | 4.4 | 2.5 | 3.2 | 3.6 | 2.9 | 8.0 | 3.3 |
| 2013 | | | | | | | | | |
| Number of deaths | 372 | 216 | 289 | 84 | 65 | 22 | 16 | 30 | 1 094 |
| Rate per 1000 live births | 3.7 | 2.9 | 4.6 | 2.4 | 3.2 | 3.6 | 2.9 | 7.4 | 3.6 |
| 2014 | | | | | | | | | |
| Number of deaths | 318 | 209 | 278 | 90 | 52 | 31 | 13 | 21 | 1 012 |
| Rate per 1000 live births | 3.5 | 2.8 | 4.4 | 2.5 | 2.6 | 5.2 | 2.3 | 5.2 | 3.4 |

⁽a) Includes all deaths within the first year of life.

Source: ABS 2015, Deaths, Australia, 2014, Cat. no. 3302.0, Canberra.

⁽b) Data are based on year of registration for the number of deaths and for the number of live births from which rates are derived. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Causes of Death collection have the same meaning.

⁽c) Some totals and figures may not compute due to rounding.

⁽d) Small numbers of registered deaths can lead to volatility in death rates.

⁽e) Includes 'other territories'.

Table EA.58 Infant mortality rate by Indigenous status, three year average (per 1000 live births) (a), (b), (c), (d), (e)

| | NSW (f) | Vic (e) | Qld (g) | WA | SA | Tas (e) A | CT (e) | NT | Aust |

| 2011–2013 | 3.5 | na | 4.2 | 2.3 | 2.7 | na | na | 4.1 | na |
| 2012–2014 | 3.4 | na | 4.1 | 2.1 | 2.7 | na | na | 3.6 | na |

- (a) Includes deaths within the first year of life.
- (b) Deaths where Indigenous status was not stated are excluded. As a result, infant death rates by Indigenous status may be underestimated.
- (c) Data based on year of registration of death (also called 'reference year').
- (d) Data are presented in three-year groupings to reduce volatility stemming from the small numbers of registered Aboriginal and Torres Strait Islander infant deaths.
- (e) Data are not available for Victoria, Tasmania or the ACT due to small numbers of registered Aboriginal and Torres Strait Islander infant deaths.
- (f) NSW data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005–2010.
- (g) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registrations of deaths on mortality indicators.

 na Not available.

⁽a) State or Territory of usual residence.

⁽b) Data are presented in three-year groupings due to volatility of the small numbers involved.

⁽c) Data based on year of registration of death (also called 'reference year').

Table EA.59 All causes infant and child mortality, by age group (a), (b), (c), (d), (e)

Unit NSW (f) Vic Qld (g) WA SA Tas ACT NT Aust (h)

- (d) Some totals and figures may not compute due to the effects of using different denominators and of rounding.
- (e) Data quality information (DQI) for some data in this table is at www.pc.gov.au/rogs/2016.
- (f) Temporary processing delays have contributed to the low number of births registered in NSW for 2014. See DQI for more information.
- (g) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registrations of deaths on mortality indicators. See DQI for more information.
- (h) All states and territories including other territories.
- (i) Includes all deaths within the first year of life. Historical data have been revised and differ from previous reports. Rates represent the number of deaths per 1000 live births.
- (j) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with zero values have not been affected by confidentialisation. See DQI for more information.
- (k) For child deaths (0–4 years), rates represent the number of deaths per 100 000 ERP (0–4 years). Child death rates for each period are the average of death registrations, divided by the average population. Rates for data to 2010–2012 are derived using ERPs based on the 2006 Census. Rates for data from 2011–2013 are derived using ERPs based on the 2011 Census. Rates derived using estimates based on different Censuses are not comparable.

| | | | | | | | |

- (a) Data exclude deaths where Indigenous status was not stated. As a result, death rates by Indigenous status may be underestimated.
- (b) Data are reported by jurisdiction of residence only for jurisdictions with a sufficient number and sufficient level of identification of Aboriginal and Torres Strait Islander deaths to support mortality analysis NSW, Queensland, WA, SA and the NT. Total includes data only for those jurisdictions.
- (c) Data are presented in five-year groupings due to volatility of the small numbers involved.
- (d) A derived ERP is used in the calculation of population rates. Non-Indigenous ERP is derived by subtracting population projections for Aboriginal and Torres Strait Islander people from the total population ERP. The ERP used for data to 2008–2012 is based on the 2006 Census. The ERP used for data from 2009–2013 is based on the 2011 census. Rates derived using estimates based on different Censuses are not comparable. See DQI for more detail.
- (e) Non-Indigenous estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Aboriginal and Torres Strait Islander population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection
- (f) Data based on year of registration of death (also called 'reference year'). See DQI for more information.
- (g) Some totals and figures may not compute due to the effects of using different denominators and of rounding.
- (h) Temporary processing delays have contributed to the low number of births registered in NSW for 2014. See data quality statements for more information.
- (i) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and deaths registrations. Queensland deaths data for 2010 have been adjusted to minimise the the impact of late registration of deaths on mortality indicators. See data quality statements for more information.
- (j) For infant deaths (less than one year) rates are per 1000 live births. Includes all deaths within the first year of life. The volatility in infant mortality rates is partially due to the relatively small number of infant deaths registered.
- (k) Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander children/infants mortality rate divided by that for non-Indigenous children/infants.
- (I) For child deaths (0–4 years), the rates represent the number of deaths per 100 000 Estimated Resident Population (0–4 years). Child death rates for this period are the average of death registrations, divided by the average projected Indigenous population and the average non-Indigenous population as derived using the total Estimated Resident Population (ERP).

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2007–2011 (final), 2012 (revised) and 2013 (preliminary). See Causes of Death, Australia, 2013 (Cat. no. 3303.0) Technical Note: Causes of Death Revisions 2011 and 2012 for further information.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001 (see data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail). Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the direct method, age standardised by 5 year age group to 85 years or over. Rates calculated using the direct method are not comparable to rates calculated using the indirect method.
- (c) Based on year of registration of death (also called 'reference year'). See DQI for further detail.
- (d) Some totals and figures may not compute due to the effects of rounding.
- (e) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for more information.
- (f) All states and territories including other territories.
 - Nil or rounded to zero. **np** not published.

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised) and 2012 (preliminary). See Causes of Death, Australia, 2012 (Cat. no. 3303.0) Technical Note: Causes of Death Revisions 2010 and 2011 for further information.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the direct method, age standardised by 5 year age group to 75 years and over. Rates calculated using the direct method are not comparable to rates calculated using the indirect method.
- (c) Non-Indigenous estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.
- (d) Data are reported by jurisdiction of residence only for jurisdictions with a sufficient number and sufficient level of identification of Aboriginal and Torres Strait Islander deaths to support mortality analysis NSW, Queensland, WA, SA and the NT. Total includes data only for those jurisdictions.
- (e) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (f) Data are presented in five-year groupings due to the volatility of small numbers each year.

Table EA.62 Age standardised mortality rates by major cause of death, by Indigenous status, 2009–2013 (a), (b), (c), (d), (e), (f), (g), (h), (i)

NSW Qld (j) WA SA NT Total (d)

- (g) Data based on reference year. See data quality information (DQI) for a more detailed explanation.
- (h) A derived ERP based on the 2006 Census is used in the calculation of total population rates. Non-Indigenous ERP was derived by subtracting Aboriginal and Torres Strait Islander projections based on the 2006 Census (3238.0) from the total population ERP. Population estimates from Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 1991 to 2021 (Cat. no. 3238.0) (based on the 2006 Census) are used to calculate Aboriginal and Torres Strait Islander rates.
- (i) Some totals and figures may not compute due to the effects of rounding.
- (j) Care should be taken when interpreting deaths data for Queensland for 2010 as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See DQI for a more detailed explanation.
- (k) Other causes consist of all conditions excluding the selected causes displayed in the table.np Not published.

Source: ABS unpublished, Causes of Death, Australia, 2013, Cat. no. 3303.0.

FTE = Full time equivalent. Historical data have been revised for updated populations and may differ from previous reports.

- (a) FTE rate (FTE per 100 000 people) is based on a standard full-time working week of 40 hours.
- (b) Data from 2011 include medical practitioners who are employed in medicine and exclude practitioners on extended leave and/or looking for work. Data for 2009 and previous years include practitioners who are employed, on extended leave and/or looking for work.
- (c) Due to rounding of average hours worked: the sum of state and territory FTE rates may not add up to total FTE rate for Australia; and, the sum of age group FTE rates may not add up to the total FTE rate for each state.
- (d) From 2011, state and territory is derived from state and territory of main job where available; otherwise state and territory of principal practice is used as a proxy. If principal practice details are also unavailable, state and territory of residence is used. If main job details are also unavailable, state and territory of residence is used. Records with no information on all three locations are coded to 'Not stated' but are included in data for Australia.
- (e) Introduction of a national data collection tool in 2010 resulted in a slight change in patterns of responses to employment-related questions. Prior to 2010, survey questions were not consistent across jurisdictions. Caution should be used in comparing data over time and, particularly for years prior to 2010, between jurisdictions. See data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.
- (f) For 2012 and subsequent years, data exclude provisional registrants.
- (g) Prior to 2010, NSW data are based on responses to the AIHW Medical Labour Force Survey weighted to financial registrants holding general, conditional specialist, limited prescribing and referring or non-practising registration.
- (h) In 2009, Victoria surveyed only general, specific and provisional registered medical practitioners in the Medical Labour Force Survey but responses are weighted to all registered medical practitioners.
- (i) In 2009, Queensland data are based on responses to the Medical Labour Force Survey weighted to all registrants excluding some conditional registration types. In 2005, responses to annual Medical Labour Force Surveys were weighted to general registrants and conditionally registered specialists only.
- (j) For WA, in 2009, the scope was consistent, that is, the survey population and the benchmark figures are based on general and conditional registrants. In 2005, the survey was administered to both general and conditional registrants but benchmark figures were for general registrants only. For WA in 2009, the benchmark data includes a significant number of registered medical practitioners that are no longer active in the workforce. This inflates the perception of the medical labour force in WA. It is also unknown how significantly past years have been affected. Care should be taken when interpreting these figures.

Table EA.63 Employed medical practitioners (a), (b), (c), (d), (e), (f)

defence force and other government agencies, compared to other jurisdictions (AIHW 2014d).

- specialists and non-practising registrants only. Caution should be used in comparing data for the ACT with other jurisdictions. Rates for the ACT are inflated as many services are provided to southern NSW residents not captured in the denominator. In addition, a relatively high proportion of pracitioners work in non-clinical roles such as educational facilities, the
- Comparisons with NT data should be made with caution due to changes in doctors' registration requirements in particular, nationally registered doctors providing fly in fly out services are no longer required to register in the NT.
- Data for Australia include employed practitioners where state or territory is unidentified and employed practitioners who are overseas.

FTE = Full time equivalent. Historical data have been revised for updated populations and may differ from previous reports.

- (a) Data from 2010 include registered and enrolled nurses and midwives who are employed in nursing and exclude nurses and midwives on extended leave. Data for 2009 and previous years include practitioners who are employed, on extended leave and/or looking for work.
- (b) FTE rate (FTE per 100 000 people) is based on standard full-time working week of 38 hours.
- (c) Data not collected in 2006 and 2010.
- (d) Due to rounding of average hours worked: the sum of state and territory FTE rates may not add up to total FTE rate for Australia; and, the sum of age group FTE rates may not add up to the total FTE rate for each state.
- (e) From 2011, state and territory is derived from state and territory of main job where available; otherwise state and territory of principal practice is used as a proxy. If principal practice details are also unavailable, state and territory of residence is used. Records with no information on all three locations are coded to 'Not stated' but are included in data for Australia.
- (f) Introduction of a national data collection tool in 2010 resulted in a slight change in patterns of responses to employment-related questions. Prior to 2010, survey questions were not consistent across jurisdictions. Caution should be used in comparing data over time and, particularly for years prior to 2010, between jurisdictions. See data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.
- (g) Because survey data for Victoria were not available in 2005, the 2006 Victorian survey responses were weighted to 2005 benchmarks. Therefore, care should be taken when comparing these data for Victoria with earlier years and in making comparisons with other states and territories in 2005. In 2008 Victorian data was affected by large numbers of online survey records not being able to be used for technical reasons. Estimates for Victoria for 2008 and 2009 should be treated with caution due to low response rate (33.3 per cent and 31.7 per cent respectively).
- (h) Queensland estimates for 2007, 2008 and 2009 should be treated with caution due to low response rates (33.9, 32.9 and 28.2 per cent, respectively). Benchmark data for Queensland in 2009 was estimated by using the total from a summary table provided to AIHW by Queensland Health prorated to the age distribution of 2008.
- (i) Estimates for WA for 2005, 2007, 2008 and 2009 should be treated with caution due to low response rates (26.9, 36.7, 34.4 and 35.4 per cent, respectively). Benchmark data for Western Australia in 2009 was estimated by using the total from the Nursing board annual report prorated to the age distribution of 2008.

W/Δ (i)

- (k) Estimates for the NT for 2004, 2007, 2008 and 2009 should be treated with caution due to low response rates (35.1, 28.7, 34.9 and 32.8 per cent, respectively). Data for NT for 2005 are not published. Benchmark data for the Northern Territory in 2009 was estimated by using the total from the Nursing board quarterly bulletin report prorated to the age distribution of 2008. Data for the NT is affected by the transient nature of the nursing labour force in that jurisdiction. According to the Nursing Board Annual Report, approximately one-third of all nurses do not re-register each year, primarily because they no longer practise in the jurisdiction. There has been some variation across years in the degree to which nurses who are interstate have
- (I) Data for Australia include employed practitioners where state or territory is unidentified and employed practitioners who are overseas.

FTE = Full time equivalent.

- (a) FTE rate (FTE per 100 000 people) is based on standard full-time working week of 38 hours.
- (b) Due to rounding of average hours worked, the sum of states and territories' FTE rates may not add up to total FTE rate for Australia and the sum of age groups FTE rates may not add up to total FTE rate for each state. The Australian total includes employed practitioners who did not state or adequately describe their state or territory of principal practice and employed practitioners who are overseas.
- (c) State and territory is derived, with the exception of medical radiation practitioners and occupational therapists, from state and territory of main job where available; otherwise state and territory of principal practice is used as a proxy. If principal practice details are unavailable, state and territory of residence is used. Records with no information on all three locations are coded to 'Not stated'. For medical radiation practitioners and occupational therapists, state and territory is derived from principal practice details.
- (d) Data exclude provisional registrants.
- (e) Allied health workforce data include practitioners in those allied health professions that are required by law to be registered with their relevant national board to practise in Australia: Aboriginal and Torres Strait Islander health practitioners, Chinese medicine practitioners, chiropractors, medical radiation practitioners, occupational therapists, optometrists, osteopaths, pharmacists, physiotherapists, podiatrists and psychologists. Data are not comparable to allied health workforce data for 2011 as Aboriginal and Torres Strait Islander health practitioners, Chinese medicine practitioners, medical radiation practitioners and occupational therapists did not join the National Registration and Accreditation Scheme until 2012.

Table EA.65 Employed allied health practitioners (a), (b), (c), (d), (e), (f)

NSW Vic Qld (g) WA (g) SA (g) Tas (g) ACT (h) NT Aust

- (f) Not all Aboriginal and Torres Strait Islander health workers are registered as Aboriginal and Torres Strait Islander health practitioners.
- (g) For 2012, due to transitional arrangements, many practitioners in some allied health professions were not required to renew their registration in all jurisdictions and so did not complete a workforce survey. Data for those professions are excluded from the affected jurisdictions, as follows:
 - data for Queensland and WA exclude medical radiation practitioners and occupational therapists
 - data for SA exclude occupational therapists
 - data for Tasmania exclude medical radiation practitioners.
- (h) Caution should be used in comparing data for the ACT with other jurisdictions. Rates for the ACT are inflated as many services are provided to southern NSW residents not captured in the denominator.

FTE = Full time equivalent. Data for 2011 to 2014 have been revised and may differ from previous reports.

⁽a) Net growth measures the change in the FTE number in the workforce in the reference year compared to the year prior to the reference year.

⁽b) FTE is based on a 40 hour standard full-time working week for medical practitioners and a 38 hour standard full-time working week for nurses and midwives.

Table EA.66 Net growth in health workforce, selected professions (a), (b), (c), (d), (e)

 $\textit{Unit} \qquad \textit{NSW} \ (f) \qquad \textit{Vic} \ (g) \qquad \textit{QId} \ (f), \ (g) \qquad \textit{WA} \ (f), \ (g) \qquad \qquad \textit{SA} \qquad \textit{Tas} \ (f), \ (g) \qquad \qquad \textit{ACT} \qquad \textit{NT} \ (g), \ (h) \qquad \qquad \textit{Aust} \ (i)$

- (c) A national data collection tool was introduced in 2010, resulting in a slight change in patterns of responses to employment-related questions. Prior to 2010, survey questions were not consistent across jurisdictions. Caution should be used in comparing data over time and, particularly for years prior to 2010, between jurisdictions. See data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.
- (d) From 2011, state and territory is derived from state and territory of main job where available; otherwise state and territory of principal practice is used as a proxy. If principal practice details are also unavailable, state and territory of residence is used. Records with no information on all three locations are coded to 'Not stated' but are included in data for Australia.
- (e) Data to 2009 are for the workforce, including practitioners who are employed, on extended leave and/or looking for work. From 2010, data are only for those employed in the workforce. Therefore, comparisons should be made with caution.
- (f) Data for 2009 for NSW, Queensland and Tasmania are underestimates, as the benchmark figures did not include all registered medical practitioners. For 2009 WA data, the benchmark data were inflated by a significant number of registered medical practitioners that are no longer active in the workforce.
- (g) For 2009, state and territory estimates should be treated with caution due to low response rates in some jurisdictions, particularly Victoria, Queensland, WA, Tasmania and the NT.
- (h) Caution should be used in comparing medical workforce data for the NT with other jurisdictions from 2010 as this was the first year of changed doctors' registration requirements (in particular, doctors providing fly in fly out services are no longer required to register in the NT where they are registered nationally).
- (i) Due to rounding of average hours worked, the total FTE for Australia may not add up to the sum of states and territories.
- (j) For nurses and midwives, data were not collected in 2010.
 - na Not available. Nil or rounded to zero. np Not published.

⁽a) Rates are age standardised by State/Territory to the 2001 estimated resident population (10 year age ranges from 15 years).

⁽b) People aged 15 years or over who: were admitted to hospital in the last 12 months; consulted a dentist in the last 3 months; visited casualty, an outpatient clinic or a day clinic in the last 2 weeks; or, consulted a GP, specialist or other health professional in the last 2 weeks.

Table EA.71 Proportion of people who accessed health services by health status, 2011-12 (a), (b), (c)

Unit NSW Vic Qld WA SA Tas ACT NT (d) Aust (c) Data are not comparable to data for 2004-05 (table EA.72) or to 2012-13 data for Aboriginal and Torres

- (c) Data are not comparable to data for 2004-05 (table EA.72) or to 2012-13 data for Aboriginal and Torres Strait Islander people (table EA.73) due to differences in survey methodology.
- (d) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (e) Total accessing casualty/outpatients/day clinic, or consulting a doctor or other health professional, in the last 2 weeks. Data are not comparable to data for 2004-05 or to 2012-13 data for Aboriginal and Torres Strait Islander people due to differences in survey methodology. np Not published.

⁽a) Rates are age standardised by State/Territory to the 2001 estimated resident population (5 year ranges from 15 years).

⁽b) People aged 15 years or over who accessed at least one of the health services noted in the table in the last two weeks or were admitted to hospital in the last 12 months.

Table EA.72 Proportion of people who accessed health services by health status, 2004-05 (a), (b), (c)

Unit NSW Vic Qld WA SA Tas ACT NT (d) Aust

- (c) Data are not comparable to data for 2011-12 (table EA.71) due to methodological differences between the surveys.
- (d) Data for the NT should be interpreted with caution as the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (e) Total persons accessing any of the selected health services noted above. Components may not add to total because persons may have accessed more than one type of health service. Data for 2004-05 are not comparable with data for 2011-12 due to methodological differences between the surveys. np Not published.

Table EA.73 Proportion of Aboriginal and Torres Strait Islander people who accessed health services by health status, 2012-13 (a), (b), (c)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

- (a) Rates are age standardised by State/Territory to the 2001 estimated resident population (10 year age ranges from 15 years).
- (b) Limited to people aged 15 years or over.
- (c) Data are not comparable to data for 2004-05 (table EA.74) or to 2011-12 data for all Australians (table EA.71) due to differences in survey methodology.
- (d) People who were admitted to hospital in the last 12 months.
- (e) People who accessed the specified health service in the last two weeks.
- (f) People who visited the dentist in the last 3 months. Data are not comparable to data for 2004-05 (table EA.74) for which the reference period was 2 weeks.
- (g) Total accessing casualty/outpatients/day clinic, or consulting a doctor or other health professional, in the last 2 weeks. Components may not add to total because people may have accessed more than one type of health service.

⁽a) Rates are age standardised by State/Territory to the 2001 estimated resident population (5 year ranges from 15 years).

⁽b) People aged 15 years or over who accessed at least one of the health services noted in the table in the last two weeks or were admitted to hospital in the last 12 months.

⁽c) Data are not comparable to 2011-12 data for all Australians (table EA.71) or to 2012-13 data for Aboriginal and Torres Strait Islander people (table EA.73) due to differences in survey methodology.

⁽d) Data for non-Indigenous people for the NT should be interpreted with caution as the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

Table EA.74

Proportion of people who accessed health services by health status, by Indigenous status, 2004-05 (a), (b), (c)

Unit NSW Vic Qld WA SA Tas ACT NT (d) Aust

Source: ABS unpublished, *National Health Survey*, 2004-05, Cat. no. 4364.0; ABS unpublished, *National Aboriginal and Torres Strait Islander Health Survey*, 2004-05, Cat. no 4715.0.

⁽e) Total people accessing at least one of the health services noted in the table. Components may not add to total because persons may have accessed more than one type of health service. Data are not comparable to 2011-12 data for all Australians or to 2012-13 data for Aboriginal and Torres Strait Islander people, due to differences in survey methodology.

⁻ Nil or rounded to zero. **np** Not published.

- (a) Rates are age standardised by State/Territory to the 2001 estimated resident population (10 year age ranges from 15 years).
- (b) People aged 15 years or over who were admitted to hospital in the last 12 months, consulted a dentist in the last 3 months or who visited casualty, an outpatient clinic, day clinic or consulted a GP, specialist or other health professional in the last 2 weeks.
- (c) Data are not comparable to data for 2004-05 (table EA.76) or to 2012-13 data for Aboriginal and Torres Strait Islander people (table EA.73) due to differences in survey methodology.
- (d) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification and are not comparable with data for previous years, which are based on a different classification.
- (e) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Total accessing casualty/outpatients/day clinic, or consulting a doctor or other health professional, in the last 2 weeks. Data are not comparable to data for 2004-05 or to 2012-13 data for Aboriginal and Torres Strait Islander people due to differences in survey methodology.
 - .. Not applicable. Nil or rounded to zero. **np** Not published.

- (a) Rates are age standardised by State/Territory to the 2001 estimated resident population (5 year ranges from 15 years).
- (b) People aged 15 years or over who accessed at least one of the health services noted in the table in the last two weeks or were admitted to hospital in the last 12 months.
- (c) Data are not comparable to data for 2011-12 (table EA.75) due to differences in survey methodology.
- (d) Remoteness areas are based on the Australian Standard Geographical Classification 2001 (ASGC) and are not comparable with data for later years, which are based on a different classification.
- (e) Data for the NT should be interpreted with caution as the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Total persons accessing any of the selected health services noted above. Components may not add to total because persons may have accessed more than one type of health service. Data are not comparable with data for 2011-12 due to methodological differences between the surveys.
 - .. Not applicable. Nil or rounded to zero. np Not published.

Source: ABS unpublished, National Health Survey, 2004-05, Cat. no. 4364.0.

- (a) Rates are age standardised by State/Territory to the 2001 estimated resident population (10 year age ranges from 15 years).
- (b) People aged 15 years or over who: were admitted to hospital in the last 12 months; consulted a dentist in the last 3 months; visited casualty, an outpatient clinic or a day clinic, or consulted a GP, specialist or other health professional, in the last 2 weeks.
- (c) Data are not comparable to data for 2004-05 (table EA.78) or to 2012-13 data for Aboriginal and Torres Strait Islander people (table EA.73) due to differences in survey methodology.
- (d) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-economic Disadvantage (IRSD). A lower SEIFA quintile indicates relatively greater disadvantage and a lack of advantage in general. A higher SEIFA quintile indicates a relative lack of disadvantage and greater advantage in general. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each State or Territory. Disaggregation by SEIFA is based on Statistical Local Area (SLA). Not all quintiles are represented in every jurisdiction.
- (e) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Total accessing casualty/outpatients/day clinic, or consulting a doctor or other health professional, in the last 2 weeks. Data are not comparable to data for 2004-05 or to 2012-13 data for Aboriginal and Torres Strait Islander people due to differences in survey methodology.
 - Nil or rounded to zero. **np** Not published.

- (a) Rates are age standardised by State/Territory to the 2001 estimated resident population (5 year age ranges from 15 years).
- (b) People aged 15 years or over who accessed at least one of the health services noted in the table in the last two weeks or were admitted to hospital in the last 12 months.
- (c) Data are not comparable to data for 2011-12 (table EA.77) due to differences in survey methodology.
- (d) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-economic Disadvantage (IRSD). A lower SEIFA quintile indicates relatively greater disadvantage and a lack of advantage in general. A higher SEIFA quintile indicates a relative lack of disadvantage and greater advantage in general. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each State or Territory. Disaggregation by SEIFA is based on SLA (Statistical Local Area). Not all quintiles are represented in every jurisdiction.
- (e) Data for the NT should be interpreted with caution as the Narional Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Total accessing any of the selected health services noted above. Components may not add to total because persons may have accessed more than one type of health service. Data are not comparable with data for 2011-12 due to methodological differences between the surveys.
 - Nil or rounded to zero. **np** Not published.

Data quality information — Health sector overview E

Data quality information

Data quality information (DQI) provides information against the seven ABS data quality framework dimensions, for a selection of performance indicators in the Health sector overview. DQI for additional indicators will be progressively introduced in future reports.

Technical DQI has been supplied or agreed by relevant data providers. Additional Steering Committee commentary does not necessarily reflect the views of data providers.

DQI are available for the following performance indicators and measures:

| Babies born of low birthweight | 2 |
|---|----|
| Prevalence of risk factors to the health of Australians | 6 |
| Prevalence of overweight and obesity | 6 |
| Rates of current daily smokers | 10 |
| Levels of risky alcohol consumption | 12 |
| Selected potentially preventable diseases | 16 |
| Incidence of selected cancers | 16 |
| Incidence of heart attacks | 19 |
| Prevalence of type 2 diabetes | 23 |
| Potentially avoidable deaths | 27 |
| Mortality and life expectancy | 31 |
| Life expectancy | 31 |
| Mortality rates — Infant and child | 33 |
| Mortality rates by major cause of death | 39 |
| Employed health practitioners | 43 |
| | |

Babies born of low birthweight

Data quality information for this indicator has been sourced from the Australian Institute of Health and Welfare (AIHW) with additional Steering Committee comments.

Indicator definition and description

Indicator

The incidence of low birthweight among liveborn babies of Aboriginal and Torres Strait Islander mothers and other mothers as a proportion of liveborn infants.

Measure/s (computation)

Numerator:

Number of low birthweight live-born singleton infants born in a calendar year.
 Low birthweight is defined as less than 2500 grams.

Denominator:

• Number of live-born singleton infants born in a calendar year.

Calculation: 100 × (Numerator ÷ Denominator)

Variability band:

 calculated using the standard method for estimating 95 per cent confidence intervals as follows:

$$CI(CR)_{95\%} = CR \pm 100 \times 1.96 \times \sqrt{\frac{\frac{CR}{100} \left(1 - \frac{CR}{100}\right)}{n}}$$

- where
 - n=number of live-born singleton infants.
 - CI = confidence interval
 - CR = crude rate (expressed as a percentage)

Data source/s

This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

For data by socioeconomic status: calculated by AIHW using the ABS' Socioeconomic Index for Areas (SEIFA) Index of Relative Socioeconomic Disadvantage (IRSD). Each Statistical Local Area in Australia is ranked and divided into quintiles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

For data by remoteness: ABS' Australian Standard Geographical Classification.

Data Quality Framework Dimensions

Institutional environment

The National Perinatal Epidemiology and Statistics Unit (NPESU) calculated this indictor on behalf of the Australian Institute of Health and Welfare (AIHW).

State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation, except in WA, where births are included if gestational age is 20 weeks or more, or, if gestation unknown, if birthweight is at least 400 grams, and in Victoria where stillbirths are included if gestational age is 20 weeks or more, or, if gestation unknown, if birthweight is at least 400 grams. It includes data items relating to the

mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

The NPDC includes all relevant data elements of interest for this indicator. Birthweight is a Perinatal NMDS item. In 2013, very few (0.06 per cent) records for live-born singleton babies were missing the data for birthweight.

Data for Indigenous status of the baby was available from all jurisdictions in 2013. Before 2012 reporting of Indigenous status of the baby is based on maternal Indigenous status. Between 2008 and 2011, this represented a relatively stable range of 73-74 per cent of all Indigenous births based on data from ABS birth registrations (ABS 2014: Births, Australia 2013).

While each jurisdiction has a unique perinatal form for collecting data on which the format of the Indigenous status question and recording categories varies slightly, all systems include the NMDS item on Indigenous status of mother since 2005 and baby since 2012.

No formal national assessment has been undertaken to determine completeness of the coverage of Indigenous mothers in the Perinatal NMDS. However, the proportion of Indigenous mothers for the period 2002–2013 has been consistent, at 3.5–4.1 per cent of women who gave birth. For maternal records where Indigenous status was not stated (0.2 per cent), data were excluded from Indigenous and non-Indigenous analyses.

The indicator is presented by Socio-Economic Indexes for Areas (SEIFA) Index of Relative Socio-Economic Disadvantage (IRSD). The 2013 data supplied to the NPDC include a code for SA2 for all jurisdictions except the ACT who supplied a code for SLA. Reporting by remoteness is in accordance with the Australian Statistical Geography Standard (ASGS).

Timeliness

The reference period for the data is 2007 to 2013. Collection of data for the NPDC is annual.

Accuracy

Inaccurate responses may occur in all data provided to the AIHW. The AIHW does not have direct access to perinatal records to determine the accuracy of the data provided. However, the AIHW and in previous years NPESU have undertaken validation on receipt of data by the States and Territories. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The NPESU does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The NPESU does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth, the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

The data supplied for the 2011 Perinatal NMDS by Victoria to prepare this indicator was provisional and subject to vary with data quality activities. Further minor changes to the data are not forseen to produce any detectable change to the indicator.

The geographical location code for the area of usual residence of the mother is included in the Perinatal NMDS. Only 0.1 per cent of records were non-residents or could not be assigned to a state or territory of residence. There is no scope in the data element Area of usual residence of mother to discriminate temporary residence of mother for the purposes of accessing birthing services from usual residence. The former may differentially impact populations from remote and very remote areas, where services are not available locally.

Birthweight is nearly universally reported with 0.06 per cent of records for 2013 missing these data overall. Data presented by Indigenous status are influenced by

the quality and completeness of Indigenous identification of mothers which is likely to differ among jurisdictions. Approximately 0.2 per cent of mothers who gave birth in 2013 had missing Indigenous status information and 3.5 per cent of babies had missing information about their Indigenous status. Jurisdictional differences in the level of 2013 data missing for maternal Indigenous status ranges from 0.0 per cent to 1.6 per cent and there may also be differences in the rates of Indigenous under-identification. Therefore, jurisdictional comparisons of Indigenous data should not be made.

Disaggregated data by Indigenous status of the mother is reported by single year for time series and by three-year combined data for the current reporting period. Disaggregated data by Indigenous status of the baby is reported by single year for time series. Single year data by Indigenous status should be used with caution due to the small number of low birthweight infants born to Indigenous mothers each year.

Coherence

Data for this indicator are published annually in Australia's mothers and babies; and biennially in reports such as the Aboriginal and Torres Strait Islander Health Performance Framework report, the Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples, and the Overcoming Indigenous Disadvantage report. The numbers presented in these publications will differ slightly from those presented here as this measure excludes multiple births and stillbirths.

Changing levels of Indigenous identification over time and across jurisdictions may also affect the accuracy of compiling a consistent time series in future years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing.

The new remoteness areas is referred to here as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA is referred to here as SEIFA 2011, and the previous SEIFA as SEIFA 2006.

Data for 2007 through to 2011 reported by remoteness are reported for RA 2006. Data for 2012 and subsequent years are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011 and previous years are not comparable to remoteness data for 2012 and subsequent years.

Data for 2007 through to 2011 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2012 and subsequent years are reported using SEIFA 2011 at the SA2 (NSW VIC, QLD, WA, SA TAS and NT) or SLA level (ACT). The AIHW considers the change from SEIFA 2006 to SEIFA 2011 to be a series break when applied to data supplied for this indicator, therefore SEIFA data for 2011 are not directly comparable with SEIFA data from previous years.

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- Australia's mothers and babies annual report
- Perinatal data portal (SAS VA) enables users to access and manipulate data from the National Perinatal Data Collection
- Indigenous mothers and their babies, Australia 2001–2004
- METeOR online metadata repository
- · National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in *Perinatal National Minimum Data Set compliance evaluation: 2006-2009.* Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Indigenous data that might affect interpretation of the indicator was published in *Indigenous mothers and their babies, Australia 2001–2004* (Chapter 1

and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository, METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and in the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

- Birthweight is included in the Perinatal National Minimum Data Set (NMDS) and data are complete for over 99.9 per cent of babies.
- This measure only includes births of at least 20 weeks gestation or 400 grams birthweight. It excludes multiple births and stillbirths and the measure may therefore differ slightly from information presented in other publications on low birthweight.
- The National Perinatal Data Collection (NPDC) includes information on the Indigenous status of the mother and baby. Since 2005, all jurisdictions have collected information on Indigenous status of the mother in accordance with the Perinatal NMDS. Indigenous status of the baby was added to the Perinatal NMDS from July 2012.
- No formal national assessment has been undertaken to determine completeness
 of the coverage or identification of Indigenous mothers in the NPDC. The current
 data have not been adjusted for under-identification of Indigenous status of the
 mother and thus jurisdictional comparisons of Indigenous data should not be
 made.
- Remoteness data for 2011 and previous years are not directly comparable to remoteness data for 2012 and subsequent years.
- SEIFA data for 2012 and subsequent years are not directly comparable with SEIFA data from previous years.

Prevalence of risk factors to the health of Australians

Prevalence of overweight and obesity

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Prevalence of risk factors to the health of Australians — Proportion of adults and children who are overweight or obese.

Measure/s (computation)

Numerator:

 Number of people aged 18 years or over with a Body Mass Index (BMI) greater than or equal to 25, and number of children aged 5–17 years exceeding age and sex specific BMI values for overweight and obesity.

Denominator:

 Number of people aged 18 years or over and number of children aged 5–17 years, for whom height and weight measurements were taken.

Calculation: 100 × (Numerator ÷ Denominator)

Data source/s

For the 2014 and subsequent Reports, the denominator and numerator for this indicator, for the general and non-indigenous population, use data from the full sample or Core component of the general population component of the ABS Australian Health Survey (AHS) from approximately 32 000 people, which is weighted to benchmarks for the total AHS in-scope estimated resident population (ERP) at 31 October 2011. This replaces data based on the National Health Survey (NHS) subset (20 500 people) of the full sample provided for the 2013 Report.

The larger sample size provides more accurate estimates and allows for analysis at a finer level of disaggregation. For more information on the structure of the AHS, see *Structure of the Australian Health Survey*.

For the 2015 and 2016 Reports, the denominator and numerator for the Aboriginal and Torres Strait Islander population use data from the full sample or Core component of the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) of approximately 13 000 people, which is weighted to benchmarks for the Australian Aboriginal and Torres Strait Islander ERP at 30 June 2011, based on the 2011 Census of Population and Housing.

This information replaces data supplied for the 2014 Report, which was based on the National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) subset (9300 people) of the full sample (13 000 people). The larger sample size used for the 2015 Report provides more accurate estimates and allows for analysis at a finer level of disaggregation. For more information on the structure of the AATSIHS, see Structure of the Australian Aboriginal and Torres Strait Islander Health Survey.

For information on scope and coverage, see the *Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide* (cat. no. 4727.0.55.002) on the ABS website, www.abs.gov.au.

Data reported for 2007-08 are from the ABS 2007-08 NHS. Data reported for 2004-05 are from the ABS 2004-05 NHS and the ABS 2004-05 NATSIHS.

Data Quality Framework Dimensions

Institutional environment

The AHS and NATSIHS were collected, processed, and published by the ABS. The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional

Environment on the ABS website, www.abs.gov.au.

Relevance

The 2011-12 AHS and 2012-13 AATSIHS collected measured height and weight from persons aged 2 years and over. For the purposes of this indicator, Body Mass Index (BMI) values are derived from measured height and weight information using the formula: weight (kg) / height (m)2.

Despite some limitations, BMI is widely used internationally as a relatively straightforward way of measuring overweight and obesity.

Timeliness

The AHS is conducted every three years over a 12 month period. Results from the Core component of the AHS were released in June 2013.

The AATSIHS is conducted over a 12 month period, approximately every 6 years. Results from the Core component of the 2012-13 AATSIHS were released in June 2014. The previous NATSIHS was conducted in 2004-05.

Accuracy

The AHS was conducted in all States and Territories, excluding very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas has a small impact on estimates, except for the NT, where such persons make up approximately 23 per cent of the population. The response rate for the 2011-12 Core component was 82 per cent. Results are weighted to account for non-response.

The AATSIHS was conducted in all States and Territories, including very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were excluded from the survey. The response rate for the Core component of the 2012-13 AATSIHS was 80 per cent. Results are weighted to account for non-response.

As they are drawn from a sample survey, data for the indicator are subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

The following comments apply to data for the general and non-Indigenous populations only.

- Data for overweight and obesity are not directly comparable to the 2004-05 NHS due to the difference in collection methodology and possible erroneous estimation of respondent self-reported measurements in 2004-05
- Data for the NT for 2011-12 are not comparable to previous years due to the increase in sample size. Data for the NT for 2007-08 should be used with caution due to large RSEs resulting from the small sample size.
- RSEs for adult overweight and obesity rates by State/Territory and Remoteness Areas are within acceptable limits, except for remote Queensland for which data should be used with caution.
- RSEs for child overweight and obesity rates by State/Territory and Remoteness
 Areas are within acceptable limits, except for inner regional WA and SA, outer
 regional New South Wales and Victoria, and total remote Australia, for which
 data should be used with caution, and for remote areas in Queensland, Western
 Australia and South Australia where rates are considered too unreliable for
 general use.
- The breakdown by State/Territory and SEIFA quintiles for adults in general has sampling error within acceptable limits, except quintile 5 in the NT which should be used with caution.
- Data by State/Territory and SEIFA quintiles for children in general have sampling error within acceptable limits, except for some quintiles in Tasmania, the Australian Capital Territory and Northern Territory which should be used with caution. Rates for quintile 5 in Tasmania and quintile 1 in the Australian Capital Territory are considered too unreliable for general use.
- Sampling errors for BMI categories for adults by State/Territory are within

acceptable limits, though rates of underweight for Tasmania and the ACT should be used with caution.

 Sampling errors for BMI data for children by State/Territory are generally within acceptable limits, though rates of underweight for most States/Territories should be used with caution.

The following comments apply to data for the Aboriginal and Torres Strait Islander population:

- Data for overweight and obesity are not directly comparable to the 2004-05 NATSIHS due to the difference in collection methodology and possible erroneous estimation of respondent self-reported measurements in 2004-05.
- Data collected on measured height, weight and waist circumference in the 2012-13 AATSIHS used the same methodology and equipment as the 2011-12 NHS (neither survey collected self-reported measurements), so the two are directly comparable.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practise.

Most surveys, including Computer-Assisted Telephone Interviewing (CATI) health surveys conducted by the States and Territories, collect only self reported height and weight. There is a general tendency across the population for people to overestimate height and underestimate weight, which results in BMI scores based on self-reported height and weight to be lower than BMI scores based on measured height and weight. Therefore, NHS and NATSIHS data for 2004-05 are not comparable with 2011–13 data which are based on measured height and weight.

The age- and sex-specific cutoff points for BMI categories for children are from the work of Cole TJ, Bellizzi MC, Flegal KM & Dietz WH 2000, Establishing a standard definition for child overweight and obesity worldwide: international survey, BMJ 320:1240.

The AHS collected a range of other health-related information that can be analysed in conjunction with BMI.

Accessibility

See Australian Health Survey: First Results (Cat. no. 4364.0.55.001) and Australian Health Survey: Health Service Usage and Health Related Actions (Cat. no. 4364.0.55.002) for an overview of results from the NHS component of the AHS. See: Australian Health Survey: Updated Results (Cat. no. 4364.0.55.003) for results from the Core component. Other information from this survey is also available on request.

The data for NATSIHS are available from the ABS website in the publication Australian Aboriginal and Torres Strait Islander Health Survey: First Results, Australia, 2012-13 (Cat. no. 4727.0.55.001). See Australian Aboriginal and Torres Strait Islander Health Survey: Updated Results (Cat. no. 4727.0.55.006) for results from the Core component of the AATSIHS. Other information from the AATSIHS is also available from the ABS website, www.abs.gov.au.

Interpretability

Information to aid interpretation of the data is available on the ABS website from the Australian Health Survey: User Guide, 2011-13 (Cat. no. 4363.0.55.001) and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, 2012-13 (Cat. no. 4727.0.55.002).

Many health-related issues are closely associated with age; therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Information for the 2015 Report for the Aboriginal and Torres Strait Islander population replaces data supplied for the 2014 Report which was based on the National Aboriginal and Torres Strait Islander Health Survey subset (9300 people) of the full sample (13 000 people). The larger sample size used for the 2015 Report provides more accurate estimates and allows for analysis at a finer level of disaggregation.

For information on how the results compare between the two samples, see *Comparison of Results in Australian Health Survey: Updated Results* (Cat. No. 4364.0.55.003).

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

- The data provide relevant information on the proportion of people who are overweight and obese.
- Data for the total and non-Indigenous populations in the AHS do not include people living in very remote areas, which affects the comparability of the NT results.
- Data by Indigenous status are not directly comparable over time as data for 2004-05 were based on self-reported height and weight and data for 2011–13 are based on measured height and weight
- Data are of acceptable accuracy. Some relative standard errors for disaggregations are greater than 25 per cent and these data should be used with caution.
- AATSIHS data are only available every six years. An assessment of the relative speed of change in results for this indicator is required to determine whether more regular data collection is necessary. Subject to cost-benefit analysis, it is recommended that relevant questions be included in both the AATSIHS and the NATSISS, to provide data on a rotating three yearly cycle across the two collections.
- The size of the standard errors mean that the survey data may not be adequate for measuring change over time. Small year to year movements may be difficult to detect if the size of the standard errors is large compared to the size of the difference between estimates.

Rates of current daily smokers

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Prevalence of risk factors to the health of Australians — Rates of current daily smokers.

Measure/s (computation)

Numerator:

• Number of persons aged 18 years or over who smoke tobacco every day.

Denominator:

• Number of people aged 18 years or over.

Calculation: 100 × (Numerator ÷ Denominator)

Data source/s

For the 2014 and subsequent Reports, the denominator and numerator for this indicator, for the general and non-indigenous population, use data from the full sample or Core component of the general population component of the ABS Australian Health Survey (AHS) from approximately 32 000 people, which is weighted to benchmarks for the total AHS in-scope estimated resident population (ERP) at 31 October 2011.

This information replaces data supplied for the 2013 Report, which was based on the National Health Survey (NHS) subset (20 500 people) of the full sample (32 000 people). The larger sample size (the full sample or core) supplied for the 2014 Report provides more accurate estimates and allows for analysis at a finer level of disaggregation. For more information on the structure of the AHS, see *Structure of the Australian Health Survey*.

For the 2015 and 2016 Report, the denominator and numerator for the Aboriginal and Torres Strait Islander population use data from the full sample or Core component of the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) of approximately 13 000 people, which is weighted to benchmarks for the Australian Aboriginal and Torres Strait Islander ERP at 30 June 2011, based on the 2011 Census of Population and Housing.

This information replaces data supplied for the 2014 Report, which was based on the National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) subset (9300 people) of the full sample (13 000 people). The larger sample size used for the 2015 Report provides more accurate estimates and allows for analysis at a finer level of disaggregation. For more information on the structure of the AATSIHS, see Structure of the Australian Aboriginal and Torres Strait Islander Health Survey.

For information on scope and coverage, see the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide (cat. no. 4727.0.55.002) on the ABS website, www.abs.gov.au.

Data reported for 2007-08 are from the ABS 2007-08 NHS and the ABS 2008 National Aboriginal and Torres Strait Islander Social Survey.

Data Quality Framework Dimensions

Institutional environment

The 2011-12 AHS and 2012-13 AATSIHS were collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website, www.abs.gov.au.

Relevance

The 2011-12 AHS and 2012-13 AATSIHS collected self-reported information on smoker status from persons aged 15 years and over. This refers to the smoking of

tobacco, including manufactured (packet) cigarettes, roll-your-own cigarettes, cigars and pipes, but excluding smoking of non-tobacco products. The 2012-13 AATSIHS included Chewing tobacco was included in the 2012-13 AATSIHS but not the 2011-12 AHS. The 'current daily smoker' category includes respondents who reported at the time of interview that they regularly smoked one or more cigarettes, cigars or pipes per day.

Timeliness

The AHS is conducted every three years over a 12 month period. Results from the Core component of the AHS were released in June 2013.

The AATSIHS is conducted over a 12 month period, approximately every 6 years. Results from the Core component of the 2012-13 AATSIHS were released in June 2014.

Accuracy

The AHS was conducted in all States and Territories, excluding very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas has a small impact on estimates, except for the NT, where such persons make up approximately 23 per cent of the population. The response rate for the 2011-12 Core component was 82 per cent. Results are weighted to account for non-response.

The AATSIHS was conducted in all States and Territories, including very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were excluded from the survey. The response rate for the Core component of the 2012-13 AATSIHS was 80 per cent. Results are weighted to account for non-response. Results are weighted to account for non-response.

As they are drawn from a sample survey, data for the indicator are subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

The following comments apply to data for the general and non-Indigenous populations:

- Data for the NT in 2011-12 are not comparable to previous years due to the increase in sample size. Data for the NT for 2007-08 should be used with caution due to large RSEs resulting from the small sample size.
- This indicator generally has acceptable levels of sampling error for State/Territory by sex and age, for persons under the age of 65 years. For persons aged 65 years or over, data should be used with caution. Rates for 18-24 year old males in the ACT and for 18-24 year old females in SA, the NT and the ACT should be used with caution.
- RSEs for adult smoking rates by State/Territory for remote areas other than in the NT, and for outer regional Victoria, are greater than 25% and should either be used with caution or are considered too unreliable for general use.
- Adult smoking rates generally have acceptable levels of sampling error for State/Territory and SEIFA quintiles, though some rates for Victoria, Queensland, South Australia, Tasmania, the ACT and the NT should either be used with caution or are considered too unreliable for general use.

The following comments apply to data for the Aboriginal and Torres Strait Islander population:

- Smoking questions were changed in the 2012-13 AATSIHS to include chewing tobacco in order to account for potential high levels of use among Aboriginal and Torres Strait Islander people. Data for 2012-13 are considered comparable with data for the Aboriginal and Torres Strait Islander population for 2007-08, and with data for the non-Indigenous population for all years.
- This indicator has acceptable levels of sampling error, with RSEs of less than 25 per cent for all states and territories.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice. The AHS collected a range of other health-related information that can be analysed in conjunction with smoker status.

Other non-ABS collections, such as the National Drug Strategy Household Survey (NDSHS), report estimates of smoker status. Results from the recent NDSHS in 2010 show slightly lower estimates for current daily smoking than in the 2011-12 AHS. These differences may be due to the greater potential for non-response bias in the NDSHS and the differences in collection methodology.

Accessibility

See Australian Health Survey: First Results (Cat. no. 4364.0.55.001) and Australian Health Survey: Health Service Usage and Health Related Actions (Cat. no. 4364.0.55.002) for an overview of results from the NHS component of the AHS. See: Australian Health Survey: Updated Results (Cat. no. 4364.0.55.003) for results from the Core component of AHS. Other information from this survey is also available on request.

The data for NATSIHS are available from the ABS website in the publication Australian Aboriginal and Torres Strait Islander Health Survey: First Results, Australia, 2012-13 (Cat. no. 4727.0.55.001). See Australian Aboriginal and Torres Strait Islander Health Survey: Updated Results (Cat. no. 4727.0.55.006) for results from the Core component of the AATSIHS. Other information from the AATSIHS is also available from the ABS website, www.abs.gov.au.

Interpretability

Information to aid interpretation of the data is available on the ABS website from the Australian Health Survey: User Guide, 2011-13 (Cat. no. 4363.0.55.001) and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, 2012-13 (Cat. no. 4727.0.55.002).

Many health-related issues are closely associated with age; therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Information for the 2015 Report for the Aboriginal and Torres Strait Islander population replaces data supplied for the 2014 Report which was based on the National Aboriginal and Torres Strait Islander Health Survey subset (9300 people) of the full sample (13 000 people). The larger sample size used for the 2015 Report provides more accurate estimates and allows for analysis at a finer level of disaggregation

For information on how the results compare between the two samples, see *Comparison of Results in Australian Health Survey: Updated Results* (Cat. No. 4364.0.55.003).

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

- The data provide relevant information on the proportion of adults who reported that they are daily smokers.
- Data for the total and non-Indigenous populations in the AHS do not include people living in very remote areas, which affects the comparability of the NT results.
- Data are of acceptable accuracy. Some relative standard errors for age, Indigenous, SES and remoteness disaggregations are greater than 25 per cent and these data should be used with caution.
- The size of the RSEs mean that the survey data may not be adequate for measuring change over time. Small year to year movements may be difficult to detect if the size of the standard errors is large compared to the size of the difference between estimates.

Levels of risky alcohol consumption

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Prevalence of risk factors to the health of Australians — Levels of risky alcohol consumption.

Measure/s (computation)

Numerator:

 Number of persons aged 18 years or over who reported an average of more than 2 standard drinks per day in the last week.

Denominator:

• Number of people aged 18 years or over.

Calculation: 100 × (Numerator ÷ Denominator)

Data source/s

For the 2014 and 2015 Reports, the denominator and numerator for this indicator, for the general and non-indigenous population, use data from the full sample or Core component of the general population component of the ABS Australian Health Survey (AHS) from approximately 32 000 people, which is weighted to benchmarks for the total AHS in-scope estimated resident population (ERP) at 31 October 2011. For information on scope and coverage, see the *Australian Health Survey: Users' Guide* (Cat. no. 4363.0.55.001) on the ABS website, www.abs.gov.au.

For the 2014 and 2015 Reports, the denominator and numerator for the Aboriginal and Torres Strait Islander population use data from the National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) component of the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) from approximately 9300 people, which is weighted to benchmarks for the Aboriginal and Torres Strait Islander ERP at 30 June 2011. For more information on the structure of the AATSIHS, see *Structure of the Australian Aboriginal and Torres Strait Islander Health Survey*.

Data reported for 2007-08 are from the ABS 2007-08 NHS. Data reported for 2004-05 are from the ABS 2004-05 NHS and the ABS 2004-05 NATSIHS.

Data Quality Framework Dimensions

Institutional environment

The AHS and NATSIHS were collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website, www.abs.gov.au.

Relevance

The 2011-12 NHS and 2012-13 NATSIHS collected self-reported information on alcohol consumption from persons aged 15 years and over. Respondents were asked to report the number of drinks of each type they had consumed, the size of the drinks, and, where possible, the brand name(s) of the drink(s) consumed on each of the most recent three days in the last week on which they had consumed alcohol.

Intake of alcohol refers to the quantity of alcohol contained in any drinks consumed, not the quantity of the drinks.

To measure against the 2009 guidelines, reported quantities of alcoholic drinks consumed were converted to millilitres (mls) of alcohol present in those drinks, using the formula:

 alcohol content of the type of drink consumed (%) x number of drinks (of that type) consumed x vessel size (in millilitres).

An average daily amount of alcohol consumed was calculated (i.e. an average over

the 7 days of the reference week), using the formula:

 average consumption over the 3 days for which consumption details were recorded x number of days consumed alcohol / 7.

According to average daily alcohol intake over the 7 days of the reference week, persons who consumed more than 2 standard drinks on any day were at risk of long term health problems.

Timeliness

The AHS is conducted every three years over a 12 month period. Results from the 2011-12 NHS component of the AHS were released in October 2012.

The AATSIHS is conducted over a 12 month period, approximately every 6 years. Results from the NATSIHS component of the AATSIHS were released in November 2013. The previous NATSIHS was conducted in 2004-05.

Accuracy

The AHS was conducted in all States and Territories, excluding very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas has a small impact on estimates, except for the NT, where such persons make up approximately 23 per cent of the population. The response rate for the 2011-12 Core component was 82 per cent. Results are weighted to account for non-response.

The AATSIHS was conducted in all States and Territories, including very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were excluded from the survey. The final response rate for the 2012-13 NATSIHS component was 80 per cent. Results are weighted to account for non-response.

As they are drawn from a sample survey, data for the indicator are subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

The collection of accurate data on quantity of alcohol consumed is difficult, particularly where recall is concerned, given the nature and possible circumstances of consumption. The use of the one week reference period (with collection of data for the most recent three days in the last week on which the person drank) is considered to be short enough to minimise recall bias but long enough to obtain a reasonable indication of drinking behaviour. While the last week exact recall method may not always reflect the usual drinking behaviour of the respondent at the individual level, at the population level this is expected to largely average out.

The collection and coding of individual brands and container size ensures that no mental calculation is required of the respondent in reporting standard drinks, and is considered to eliminate potential for the underestimation bias which is known to occur when people convert drinks into standard drinks.

The following comments apply to data for the general and non-Indigenous populations only.

- Data for the NT in 2011-12 are not comparable to previous years due to the increase in sample size in 2011-12. Data for the NT for 2007-08 should be used with caution due to large RSEs resulting from the small sample size
- This indicator generally has acceptable levels of sampling error for State/Territory and Remoteness Areas, except for remote areas where some rates are considered too unreliable for general use. The breakdown by State/Territory and SEIFA quintiles in general has sampling error within acceptable limits, except for the two lowest quintiles in the ACT which should either be used with caution or are considered too unreliable for general use.

Coherence

The AHS and AATSIHS collected a range of other health-related information that can be analysed in conjunction with alcohol risk level. For more detailed information see the Australian Health Survey: Users' Guide and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, available on the ABS website.

Aggregate levels of alcohol consumption implied by the AHS are somewhat less than the estimates of apparent consumption of alcohol based on the availability of alcoholic beverages in Australia from taxation and customs data, see *Apparent Consumption of Alcohol*, 2010-11 (Cat. no. 4307.0.55.001). This suggests a tendency towards under-reporting of alcohol consumption in self-report surveys.

Other collections, such as the National Drug Strategy Household Survey (NDSHS), report against the same NHMRC guidelines. Results from the most recent NDSHS in 2010 show slightly lower estimates for long-term harm from alcohol than in the 2011-13 AHS. These differences may be due to the greater potential for non-response bias in the NDSHS and the differences in collection methodology.

Accessibility

See Australian Health Survey: First Results (Cat. no. 4364.0.55.001) and Australian Health Survey: Health Service Usage and Health Related Actions (Cat. no. 4364.0.55.002) for an overview of results from the NHS component of the AHS. See: Australian Health Survey: Updated Results (Cat. no. 4364.0.55.003) for results from the Core component of AHS. Other information from this survey is also available on request.

The data for NATSIHS are available from the ABS website in the publication Australian Aboriginal and Torres Strait Islander Health Survey: First Results, Australia, 2012-13 (Cat. no. 4727.0.55.001). Other information from the survey is available on request.

Interpretability

Information to aid interpretation of the data is available on the ABS website from the Australian Health Survey: User Guide, 2011-13 (Cat. no. 4363.0.55.001) and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, 2012-13 (Cat. no. 4727.0.55.002).

Many health-related issues are closely associated with age; therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on the proportion of adults who are at risk of long-term harm from alcohol.
- Data for the total and non-Indigenous populations in the AHS do not include people living in very remote areas, which affects the comparability of results for the NT.
- Data are of acceptable accuracy. Some relative standard errors for Indigenous status, SES and remoteness disaggregations are greater than 25 per cent and should be used with caution.
- The size of the standard errors means that the survey data may not be adequate
 for measuring change over time. Small year to year movements may be difficult
 to detect if the size of the standard errors is large compared to the size of the
 difference between estimates.
- AATSIHS data are only available every six years. An assessment of the relative speed of change in results for this indicator is required to determine whether more regular data collection is necessary. Subject to cost-benefit analysis, it is recommended that relevant questions be included in both the AATSIHS and the NATSISS, to provide data on a rotating three yearly cycle across the two collections.

Selected potentially preventable diseases

Incidence of selected cancers

Data quality information for this indicator has been sourced from the Australian Institute of Health and Welfare (AIHW) with additional Steering Committee comments.

Indicator definition and description

Indicator

Selected potentially preventable diseases — Incidence of selected cancers

Measure/s (computation)

The selected cancers of public health importance are bowel cancer, lung cancer, melanoma of the skin, breast cancer in females and cervical cancer.

For bowel cancer, lung cancer and melanoma, the numerator is the number of new cases occurring in the Australian population in the reported year. The denominator is the total Australian population for the same year.

For breast and cervical cancer the numerator is the number of new cases occurring in the Australian female population in the reported year. The denominator is the total Australian female population for the same year.

Calculation is 100 000 × (Numerator ÷ Denominator), calculated separately for each type of cancer, presented as a rate per 100 000 and age-standardised to the Australian population as at 30 June 2001.

Data source/s

Numerators: Australian Cancer Database (ACD)

Denominators:

- For bowel cancer, lung cancer and melanoma: Australian Bureau of Statistics (ABS) Estimated Resident Population (ERP).
- For breast and cervical cancer: ABS ERP for female population.
- For data by Indigenous status: ABS Aboriginal and Torres Strait Islander Estimates and Projections (Indigenous population) Series B.
- For data by Remoteness area: ABS ERPs for Australian Standard Geographical Classifications (ASGC) Remoteness Areas.
- For data by socioeconomic status: calculated by AIHW using the ABS 2011 Index
 of Relative Socio-economic Disadvantage (IRSD) and ERPs by Statistical Area
 Level 2 (SA2). Each SA2 in Australia is ranked by IRSD score and divided into
 quintiles and deciles in a population-based manner, such that each quintile has
 approximately 20 per cent of the population and each decile has approximately
 10 per cent of the population.

Data Quality Framework Dimensions

Institutional environment

The National Cancer Statistics Clearing House (NCSCH), housed at the AIHW, is a collaborative partnership between the AIHW and the Australasian Association of Cancer Registries (AACR).

Cancer incidence data are supplied to the AIHW by state and territory cancer registries. These data are compiled by AIHW to form the Australian Cancer Database (ACD). All jurisdictions have legislation requiring mandatory reporting of all cancer cases with the exception of basal cell carcinoma of the skin and squamous cell carcinoma of the skin.

Relevance

The data used to calculate this indicator are accurate and of high quality. The mandatory reporting of cancers and the use of ERPs based on Census data for denominators provides the most comprehensive data coverage possible. The data are appropriate for this indicator.

Timeliness

The most recent data available for inclusion in this indicator are 2012 for all jurisdictions except NSW and the ACT, for which the most recent data available are for 2010. Estimates are provided for NSW and the ACT for 2011.

Accuracy

The 2011 incidence data for NSW and the ACT were estimated by the AIHW.

Although the estimation procedure has been shown to be reasonably accurate for estimating overall cancer incidence, its accuracy with respect to individual cancers will vary. Until the actual 2011 cancer data are available from these jurisdictions caution should be exercised when comparing data for 2011 for NSW, the ACT and national totals with data from previous years. The estimates of 2011 incidence in NSW and ACT cannot be disaggregated by Indigenous status, remoteness area or socioeconomic status. The national totals for 2011 for these tables do not include NSW and ACT and are not comparable with data for previous years.

The 2009 data for NSW and the ACT provided to the AIHW excluded provisional death-certificate-only (DCO) cases, as did the 2010 data for the ACT. The AIHW has estimated the number of provisional DCO cases in 2009 for each cancer, sex and age group based on the numbers observed for 2004–2008. Overall for the five cancers covered in the Indicator, about 1.2 per cent of NSW cases and 1.4 per cent of ACT cases are estimated DCO cases. The percentage varies by cancer type.

For Indigenous status, the numerator for 'Indigenous' is the number of people who self-reported that they were Indigenous at the time of diagnosis. 'Other' includes those who self-reported that they were not Indigenous at the time of diagnosis and those who chose not to identify as either Indigenous or non-Indigenous. The completeness of Indigenous identification in cancer registry data varies between jurisdictions. Those with sufficiently complete identification to enable reliable reporting of cancer incidence rates are NSW, Vic, Qld, WA and NT. Indigenous data for the other jurisdictions are not published. As national totals data for 2011 and 2012 exclude NSW and the ACT they cannot be compared to data for earlier reference years.

Socioeconomic status rankings (by IRSD score) are calculated by SA2 using a population-based method at the Australia-wide level. That is, the quintiles are national quintiles, not state and territory quintiles.

An SA2-to-remoteness-area concordance and SA2-to-socioeconomic-status concordance were used to allocate remoteness area and socioeconomic status to each record on the ACD based on the person's SA2 of residence at time of diagnosis.

Caution is required when examining differences across remoteness area and socioeconomic status categories. The SA2 of a person is determined by the cancer registry based on the address provided by the person. Some people may supply an address other than that where they normally reside or the details the person provides may not correspond to a valid address meaning that their cancer record cannot be allocated to a remoteness area or socioeconomic status category at all. Such records are excluded from the tables and this may affect some remoteness area and socioeconomic categories more than others. Also, because the concordances are based on the 2011 census, SA2 boundaries may have changed over time and these can create inaccuracies.

Due to the very small number of diagnoses involved, disaggregation by Indigenous status, or remoteness area, or socioeconomic status by state and territory is not necessarily robust.

This indicator only counts one year of incidence data. For jurisdictions that record relatively small numbers of cancers, rates may fluctuate widely from year to year; these changes should be interpreted with caution.

This indicator is calculated based on data that have been supplied to the AIHW and undergone extensive checks at both the source cancer registry and the AIHW. The state and territory cancer registries have checked the tables and given their approval for the AIHW to supply them to the Productivity Commission.

These data are published annually by the AIHW. While there are sometimes changes to coding for particular cancers, it is possible to map coding changes to make meaningful comparisons over time.

Not all state and territory cancer registries use the same ICD-10 code groupings to classify certain cancers, e.g. the AIHW defines bowel cancer as ICD-10 codes C18—C20 whereas some cancer registries also include C21. This may mean that data presented here are different to those reported by jurisdictional cancer registries, for certain cancers. The definitions used in this Indicator are as follows.

Coherence

• Bowel cancer: ICD-10 codes C18-C20

Lung cancer: ICD-10 codes C33–C34

• Melanoma of the skin: ICD-10 code C43

• Breast cancer in females: ICD-10 code C50 and sex female

Cervical cancer: ICD-10 code C53.

The Cancer Institute NSW (CINSW) uses an imputation method to impute missing Indigenous status for reporting purposes. This may lead to differences between the Indigenous rates presented for NSW in this Indicator and the Indigenous rates presented in CINSW incidence reports.

The incidence rate in Indigenous Australians may fluctuate considerably from year to year due to the behaviour of rare events in small populations.

Accessibility

Cancer publications and annually-updated data are freely available on the AIHW website http://www.aihw.gov.au/. More specialised data can be requested via the website by lodging a customised data request. These are charged for on a cost-recovery basis.

Interpretability

While numbers of new cancers are easy to interpret, calculation of age-standardised rates is more complex and the concept may be confusing to some readers. Information on how and why age-standardised rates have been calculated and how to interpret them is available in all AIHW cancer publications presenting data in this format, for example, *Cancer in Australia: an overview, 2014.* Information about interpreting cancer data and the ACD is available on the AIHW website.

Data Gaps/Issues Analysis

Key data gaps /issues

- 2011 and 2012 incidence data for NSW and ACT were not available for inclusion in the ACD. The development of the new NSW Cancer Registries system has resulted in a delay in processing incidence data for 2011 onwards and therefore the most recent NSW data available for inclusion in the ACD are for 2010. As the coding of ACT cancer notifications is contracted to the NSW Cancer Registry, the most recent data available for the ACT are also for 2010. The 2011 incidence data for NSW and the ACT were estimated by the Australian Institute of Health and Welfare (AIHW). Although the estimation procedure has been shown to be reasonably accurate for estimating overall cancer incidence, its accuracy with respect to individual cancers will vary. Until the actual 2011 cancer data are available from these jurisdictions caution should be exercised when comparing the 2011 NSW, ACT and Australian data with data from previous years. Estimates of 2011 incidence in NSW and ACT cannot be disaggregated by Indigenous status, remoteness area or socioeconomic status. National totals for 2011 for these tables do not include NSW and the ACT and are not comparable with totals form previous years.
- For jurisdictions that record relatively small numbers of cancers, rates may fluctuate widely from year to year; these changes over time should be interpreted with caution.
- The completeness of Indigenous identification in cancer registry data varies between jurisdictions. Those with sufficiently complete identification to enable reliable reporting of cancer incidence rates are NSW, Vic, Qld, WA and NT. Indigenous data for the other jurisdictions are not published.
- The Cancer Institute NSW (CINSW) uses an imputation method to impute missing Indigenous status for reporting purposes. This may lead to differences between the Indigenous rates presented for NSW in this Indicator and the Indigenous rates presented in CINSW incidence reports.
- The incidence rate for Indigenous Australians may fluctuate considerably from year to year due to the behaviour of rare events in small populations.
- Remoteness area and socioeconomic status are based on Statistical Area Level 2 (SA2) of residential address at the time of diagnosis.

Incidence of heart attacks (acute coronary events)

Data quality information for this indicator has been sourced from the Australian Institute of Health and Welfare (AIHW) with additional Steering Committee comments.

Indicator definition and description

Indicator

Selected potentially preventable diseases — Incidence of heart attacks (acute coronary events).

Measure/s (computation)

Number of deaths recorded with an underlying cause of acute coronary heart disease (ICD-10 codes I20–I24) (a) plus the number of non-fatal hospitalisations with a principal diagnosis of acute myocardial infarction (ICD-10-AM I21) or unstable angina (ICD-10-AM I20.0) that do not end in a transfer to another acute hospital (b). The number of acute coronary events is estimated by (a) + (b). For ages 25 years and over.

Denominator: Total population aged 25 years and over for year in question.

Rates: 100,000 x (numerator ÷ denominator).

Age specific rates are presented for each 10 year age group 25 years or over. Jurisdiction specific rates are provided for each state/territory.

Total rates are directly age-standardised to the 2001 Australian population using 10 year age groups.

Indigenous

National incidence estimates for Indigenous and other Australians are calculated based on data from NSW, Qld, SA, WA and NT only.

Indigenous rates are directly age-standardised to the 2001 Australian population using 10 year age groups.

The estimates for Indigenous and Other Australians are derived using only data from the five jurisdictions where the quality of identification is considered reasonable in both the NHMD and the NMD (NSW, Qld, WA, SA and NT).

Data source/s

Numerator: AIHW National Hospital Morbidity Database (NHMD), AIHW National Mortality Database (NMD)

Denominator:

- For total population: Australian Bureau of Statistics (ABS) Estimated Resident Population (ERP) as at 30 June (final rebased for years to 2011; preliminary for 2012 and 2013).
- For data by Indigenous status: ABS Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (Series B).

Data Quality Framework Dimensions

Institutional environment

The AIHW has calculated this indicator using data extracted from the AIHW NHMD, the NMD and ABS population data.

The AIHW is a national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through authoritative health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and

non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of *Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth)*, ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Relevance

The data provide an estimate of the incidence of acute coronary events in Australia and in each jurisdiction, based on administrative data currently available. Non-fatal events are estimated from the NHMD and fatal events from the NHMD.

It is an estimate of 'events', not individuals. It should be noted that an individual may have multiple events in the one year or in different years. Each would be counted. Further, an individual may have one acute coronary event which resulted in multiple hospitalisations, due to transfers for treatment and on-going care. In the NHMD these are recorded as multiple unlinked hospital episodes. The method of estimation attempts to take account of duplicate events in the databases by excluding hospitalisations ending in a transfer to another acute hospital (so that each acute coronary syndrome (ACS) event is counted only once, regardless of the number of hospitalisation episodes per event) and by excluding hospitalisations for ACS ending in death in hospital (as these should be picked up in the NMD data).

The method of estimation has been developed based on an analysis of hospital and deaths data validated using linked data from WA and NSW (AIHW 2014, *Acute coronary syndrome: validation of the method used to monitor incidence in Australia*, Cat. no. CVD 68. Canberra) www.aihw.gov.au/WorkArea/DownloadAsset.aspx? id=60129547560.

The year in which the event occurred is determined from the separation date for hospitalisations, and from the year of registration of death. Data are reported by the state or territory of usual residence of the person at the time of hospitalisation or death.

Variability across jurisdictions (particularly in hospital transfer rates) indicates that the method of estimation may lead to an underestimation of incidence in some jurisdictions. This variation may be due to differences in treatment and referral patterns but could also be due to differences in data recording practices. Rates for Indigenous and Other Australians are based on data from those jurisdictions where the quality of identification is considered reasonable in both the NHMD and the NMD. NMD data from 5 jurisdictions (NSW, Qld, WA, SA and NT) have been assessed by the AlHW as having adequate Indigenous identification from 1998 onwards and only these 5 jurisdictions are included in the estimates reported by Indigenous status. Rates for Other Australians are calculated by subtracting Indigenous estimates from total estimates for the five jurisdictions divided by the population of Other Australians in those jurisdictions. Other Australians therefore includes non-Indigenous people and people whose Indigenous status was not stated or inadequately described.

Timeliness

Accuracy

This indicator reports the latest information available (for years 2007 to 2013).

Assessment of validity based on linked and unlinked data from WA and NSW has shown that the method underestimates the incidence of acute coronary events in at least those states. Nonetheless, these estimates provide a reasonable measure of the incidence of acute coronary events and may be useful for recording and monitoring each jurisdiction's progress over time.

Comparison between jurisdictions should not be made as the assessment of validity suggested variations in the under-count of acute coronary event rates, as observed in WA and NSW (6% in WA and 11% in NSW in 2007). Factors such as differing treatment and referral patterns and data recording practices across states/territories are likely to have an impact on administrative records and affect jurisdictional comparability.

The accuracy of the estimates will depend on the accuracy of coding in the NHMD and the NMD (see data sources for DQS for each data source). In particular the accuracy of coding of principal diagnosis, hospital transfers, deaths in hospital and underlying cause of death are central to the accuracy of the estimates.

The accuracy of Indigenous estimates is also reliant on the appropriate identification of Indigenous people in the NHMD and the NMD. NMD data from 5 jurisdictions (NSW, Qld, WA, SA and NT) have been assessed by the AlHW as having adequate Indigenous identification from 1998 onwards and only these 5 jurisdictions are included in the estimates reported by Indigenous status. . Indigenous counts for the NT exclude acute coronary events treated in the private hospital in the NT. All non-fatal events treated in the private hospital in the NT are therefore included in the incidence counts for other Australians.

Data for 2010 have been adjusted for the additional deaths arising from outstanding registrations of deaths in Queensland in 2010. Deaths occurring between 1992 and 2006 but registered in 2010 by the Queensland Registry of Births, Deaths and Marriages are excluded from the estimates for Indigenous and Other Australians. For more details please refer to Technical note 3 in *Causes of death, Australia, 2010* (ABS cat. no. 3303.0).

NMD data for 2011 and 2012 have been revised since the 2015 Report. For the 2016 Report, deaths registered in 2011 and earlier are based on the final version of cause of death data; deaths registered in 2012 and 2013 are based on revised and preliminary versions respectively and are subject to further revision by the ABS.

Coherence

This is the fourth year in which this indicator has been reported. This is the second year in which this indicator is reported for each jurisdiction.

Accessibility

The AIHW provide a variety of products that draw upon the NMD and NHMD including online data cubes and reports.

These products may be accessed on the AIHW website:

- 'http://www.aihw.gov.au/hospitals/
- www.aihw.gov.au/deaths/.

Interpretability

NHMD

The NHMD data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from public and private hospitals. States and territories use these data for service planning, monitoring, and internal and public reporting. Hospitals may be required to provide data to states and territories through administrative arrangements, contractual requirements or legislation.

The scope of the NHMD is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

States and territories supplied these data to the AIHW under the terms of the *National Health Information Agreement*.

The data quality statement for the AIHW NHMD can be found in http://meteor.aihw.gov.au/content/index.phtml/itemld/611030 with summary data quality information in Appendix A of Admitted patient care 2013–14: Australian hospital statistics or at http://www.aihw.gov.au/publication-detail/?id=60129550483

NMD

Cause of Death Unit Record File data are provided to the AIHW by the Registries of Births, Deaths and Marriages and the National Coronial Information System (managed by the Victorian Department of Justice) and include cause of death coded by the Australian Bureau of Statistics (ABS). The data are maintained by the AIHW in the National Mortality Database.

The data quality statements for the AIHW National Mortality Database can be found in the following ABS publications:

- ABS Quality declaration summary for Causes of death, Australia (Cat. no. 3303.0) www.abs.gov.au/ausstats/abs@.nsf/mf/3303.0/ and
- ABS Quality declaration summary for Deaths, Australia (Cat. no. 3302.0) www.abs.gov.au/ausstats/abs@.nsf/mf/3302.0/.

For more information on the AIHW National Mortality Database see Deaths data at AIHW www.aihw.gov.au/deaths/aihw-deaths-data/.

Data Gaps/Issues Analysis

Key data gaps /issues

- This indicator estimates the incidence of acute coronary events from the National Hospital Morbidity Database (NHMD) and the National Mortality Database (NMD).
- The methodology for estimating the incidence of acute coronary events is based on AIHW analysis of hospital and mortality data, and has been validated using linked data from WA and NSW.
- The accuracy of the estimates is reliant on the accuracy and consistency of coding of the principal diagnosis and underlying cause of death in each jurisdiction. It also relies on the accuracy of coding of transfers to another acute hospital and of death in hospital.
- Comparisons between jurisdictions should not be made as variations in key variables (particularly in transfer rates between hospitals) are likely to impact on jurisdictional comparability. The assessment of validity showed an underestimation of the incidence of acute coronary events in WA and NSW. The extent of this cannot be measured precisely for other jurisdictions without linked data sets for all states and territories.
- National estimates by age and sex are derived using data from all jurisdictions.
- Estimates for each jurisdiction are derived using state/territory of usual residence.
- 'NMD data from 5 jurisdictions (NSW, Qld, WA, SA and NT) have been assessed by the AIHW as having adequate Indigenous identification from 1998 onwards. Estimates for Indigenous and other Australians are derived using only data from these five jurisdictions because the quality of identification is considered reasonable in both the NHMD and the NMD.

Prevalence of type 2 diabetes

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Selected potentially preventable diseases — Prevalence of type 2 diabetes

Measure/s (computation)

Numerator:

- number of persons aged 18 years or over with known diabetes (type 2) or newly diagnosed diabetes as determined by a fasting plasma glucose test.
- number of persons aged 25 years and over with known diabetes (Type 2) or newly diagnosed diabetes as determined by a fasting plasma glucose test (supplementary measure).

Denominator:

- · Number of persons aged 18 years and over
- Number of persons aged 18 years and over(supplementary measure).

Data source/s

The numerator and denominator for this indicator for the general and non-Indigenous populations use data from the 2011-12 National Health Measures Survey (NHMS) component of the Australian Bureau Statistics (ABS) Australian Health Survey (AHS) (approximately 9500 people aged 18 years or over), which is weighted to benchmarks for the total AHS in-scope population as at 31 October 2011 derived from the Estimated Resident Population (ERP).

For information on the structure of the AHS, see *Structure of the Australian Health Survey* on the ABS website, www.abs.gov.au. For information on scope and coverage, see *the Australian Health Survey: Users' Guide* (Cat. no. 4363.0.55.001) on the ABS website, www.abs.gov.au.

The numerator and denominator for this indicator for the Aboriginal and Torres Strait Islander population use data from the 2012-13 National Aboriginal and Torres Strait Islander Health Measures Survey (NATSIHMS) component of the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) of approximately 3300 people, which is weighted to benchmarks for the Australian Aboriginal and Torres Strait Islander estimated resident population at 30 June 2011, based on the 2011 Census of Population and Housing.

For information on the structure of the AATSIHS, see *Structure of the Australian Aboriginal and Torres Strait Islander Health Survey* on the ABS website, www.abs.gov.au.

For information on scope and coverage, see the *Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide* (Cat. no. 4727.0.55.002) on the ABS website, www.abs.gov.au.

Data Quality Framework Dimensions

Institutional environment

The AHS and AATSIHS were collected, processed and published by the ABS. The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

The interview components of the AHS and AATSIHS were conducted under the *Census and Statistics Act 1905*. The biomedical components (NHMS and NATSIHMS) were collected under the *Privacy Act 1988* and were subject to ethics approval which at the national level was sought and gained from the (then) Australian Government Department of Health and Ageing's Departmental Ethics Committee.

Ethics approval for the NATSIHMS component was also required at the jurisdictional level for NSW, WA, the NT and for Queensland Health Service Districts. Ethics approval was sought and gained from the following Ethics Committees:

Aboriginal Health and Medical Research Council Ethics Committee in NSW

- · Aboriginal Health Research Ethics Committee in SA
- Western Australian Aboriginal Health Ethics Committee in WA
- Western Australia Country Health Service (WACHS) Research Ethics Committee in WA
- Central Australian Human Research Ethics Committee in the NT
- Human Research Ethics Committee of the Northern Territory Department of Health and Menzies School of Health Research in the NT
- several Human Research Ethics Committees of Queensland Government Hospital and Health Services districts.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website, www.abs.gov.au.

Relevance

The The 2011-12 NHMS and 2012-13 NATSIHMS use a combination of blood test results for fasting plasma glucose and self-reported information on diabetes diagnosis and medication use to measure prevalence of Type 2 diabetes.

A respondent to the survey is considered to have known diabetes (type 2) if they had ever been told by a doctor or nurse that they have Type 2 diabetes and:

- They were taking diabetes medication (either insulin or tablets); or
- Their blood test result for fasting plasma glucose was greater than or equal to 7.0 mmol/L.

A respondent to the survey is considered to have newly diagnosed diabetes if they reported no prior diagnosis of diabetes, but had a fasting plasma glucose value greater than or equal to 7.0 mmol/L.

Note: The type of diabetes for newly diagnosed cases cannot be determined from a fasting plasma glucose test alone. However, as it is assumed that the vast majority of newly diagnosed cases would be Type 2, all newly diagnosed cases of diabetes have been included in this measure.

The estimates exclude persons who did not fast for 8 hours or more prior to their blood test. Excludes women with gestational diabetes.

The same definition for diabetes will be used in the NATSIHMS.

Timeliness

The NHMS was conducted in 2011-12 with results released in August 2013.

The NATSIHMS was conducted in 2012-13 with results released in September 2014.

Accuracy

The AHS was conducted in all States and Territories, excluding very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas has a small impact on estimates, except for the Northern Territory, where such persons make up approximately 23 per cent of the population. The final response rate for the 'core' component of the AHS was 82 per cent.

All selected persons aged 5 years and over were invited to participate in the voluntary NHMS. Of all of those who took part in the AHS, 37 per cent went on to complete the biomedical component.

Analysis of the sample showed that the characteristics of persons who participated in the NHMS were similar with those for the AHS overall. The only significant difference was for smoking, where the NHMS sample had a lower rate of current smokers than the AHS sample (12.0 per cent compared with 17.6 per cent). For more information, see the Explanatory Notes in *Australian Health Survey: Biomedical Results for Chronic Disease* (Cat. no. 4364.0.55.005).

In order to get an accurate reading for the fasting plasma glucose test, participants were asked to fast for 8 hours before their test. The results presented for this indicator refer only to those people who did fast (approximately 79 per cent of adults who participated in the NHMS). Analysis of the characteristics of people who fasted compared with those who did not fast showed no difference between fasters and non-fasters.

The AATSIHS was conducted in all States and Territories, including very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were excluded from the survey. The response rate for the Core component of the 2012-13 AATSIHS was 80%.

All selected persons aged 18 years and over in the AATSIHS were invited to participate in the voluntary NATSIHMS. Of these, 40% went on to complete the biomedical component.

Analysis of the sample showed that the characteristics of persons who participated in the NATSIHMS were similar to those for the AATSIHS overall. For more information, see the Explanatory Notes in *Australian Aboriginal and Torres Strait Islander Health Survey: Biomedical Results* (Cat. no. 4727.0.55.003).

In order to get an accurate reading for the fasting plasma glucose test, participants were asked to fast for 8 hours before their test. The results presented for this indicator refer only to those people who did fast (approximately 77.6% of adults who participated in the NATSIHMS). Analysis of the characteristics of people who fasted compared with those who did not fast showed no difference between fasters and non-fasters.

As they are drawn from a sample survey, data for the indicator are subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

For the general and non-Indigenous populations, this indicator and the supplementary indicator generally have acceptable levels of sampling error for State/Territory by sex. However, rates for females in Victoria, males in the ACT, and males and females in the NT should be used with caution.

For the Aboriginal and Torres Strait Islander population, rates for males and females in Queensland, females in WA and WA, and males in the NT should be used with caution. Additionally, the rate for total all persons in SA should be used with caution. The rate for males in SA is considered too unreliable for general use.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections. The AHS collected a range of other health-related information that can be analysed in conjunction with diabetes status.

Other non-ABS collections, such as the 1999–2000 Australian Diabetes, Obesity and Lifestyle Study (AusDiab) and the 2009-10 Victorian Health Monitor (VHM) have reported estimates of diabetes prevalence based on biomedical measures and self-reported diagnosis and medication use.

Results from the recent VHM were very similar to those from the NHMS. Results from AusDiab showed higher estimates of diabetes than the NHMS, however this difference is most likely due to the difference in test used to measure diabetes (AusDiab used an Oral Glucose Tolerance test, which is a more comprehensive test for diabetes than fasting plasma glucose).

For information on how these studies compare, see *Australian Health Survey: Biomedical Results for Chronic Disease* (Cat. no. 4364.0.55.005).

Accessibility

See Australian Health Survey: Biomedical Results for Chronic Disease (cat. no. 4364.0.55.005). Other information from this survey is also available on request.

Interpretability

Information to aid interpretation of the data is available from the Australian Health Survey: Users' Guide and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide (Cat. no. 4727.0.55.002) on the ABS website.

Many health-related issues are closely associated with age; therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on the prevalence of Type 2 diabetes.
- The 2011-12 NHMS was conducted for the first time as part of the 2011–13 AHS, with participation voluntary in the NHMS. Of those who took part in the AHS, 38 per cent took part in the NHMS. The NHMS sample was found to be similar to the AHS population.
- The 2012-13 NATSIHMS was conducted for the first time as part of the 2012-13 AATSIHS, with participation voluntary in the NATSIHMS. Of those who took part in the AATSIHS, 40 per cent took part in the NATSIHMS. The NHMS sample was found to be similar to the overall of the AATSIHS population.
- The NHMS does not include people living in very remote areas, which affects the comparability of the NT results.
- Data are of acceptable accuracy. Some RSEs for disaggregations are greater than 25 per cent and these data should be used with caution.

Potentially avoidable deaths

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Potentially avoidable deaths

Measure/s (computation)

Numerator: Number of death registrations of persons aged less than 75 provided by state and territory Registrars of Births, Deaths and Marriages which have an ICD-10 code which has been further classified as potentially avoidable according to the NHA: PI 16 – Potentially avoidable deaths, 2015 revised specifications, for:

- 5 year aggregates 2003–2007, 2004–2008, 2005–2009, 2006–2010, 2007–2011, 2008–2012 (updated for revision to ABS cause of death data), 2009–2013
- single years 2007, 2008, 2009, 2010, 2011, 2012 (updated for revision to ABS cause of death data) and 2013.

Denominator: Population aged less than 75 years.

Data source/s

Numerator: ABS Causes of Death collection (Cat. no. 3303.0)

Denominator: ABS ERP (3101.0); ABS 2014 Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001–2026 (Cat. no. 3238.0), Series B.

For the non-Indigenous population, the projected Indigenous population (Cat. no. 3238.0, Series B) is subtracted from the 2011 Census-based ERP.

Data Quality Framework Dimensions

Institutional environment

These collections are conducted under the *Census and Statistics Act 1905*. For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, see ABS Institutional Environment.

Relevance

The ABS Causes of Death collection includes all deaths that occurred and were registered in Australia, including deaths of persons whose usual residence is overseas. Deaths of Australian residents that occurred outside Australia may be registered by individual Registrars, but are not included in ABS deaths or causes of death statistics.

Data in the Causes of Death collection include demographic items, as well as causes of death information, which is coded according to the International Statistical Classification of Diseases and Related health Problems (ICD). ICD is the international standard classification for epidemiological purposes and is designed to promote international comparability in the collection, processing, classification, and presentation of causes of death statistics. The classification is used to classify diseases and causes of disease or injury as recorded on many types of medical records as well as death records. The ICD has been revised periodically to incorporate changes in the medical field. The 10th revision of ICD (ICD-10) has been used by the ABS to code cause of death since 1997.

For further information on the ABS Causes of Death collection, see the relevant Data Quality Statement.

Timeliness

Causes of death data is published on an annual basis. Death records are provided electronically to the ABS by individual Registrars on a monthly basis for compilation into aggregate statistics on a quarterly and annual basis. One dimension of timeliness in death registrations data is the interval between the occurrence and registration of a death. As a result, a small number of deaths occurring in one year are not registered until the following year or later.

Preliminary ERP data is compiled and published quarterly and is generally made available five to six months after the end of each reference quarter. Every year, the 30 June ERP is further disaggregated by sex and single year of age, and is made available five to six months after the end of the reference quarter. Commencing with data for September quarter 2006, revised estimates are released annually and made

available 21 months after the end of the reference period for the previous financial year, once more accurate births, deaths and net overseas migration data becomes available. In the case of births and deaths, the revised data is compiled on a date of occurrence basis. In the case of net overseas migration, final data is based on actual traveller behaviour. Generally ERP data is not changed once it has been finalised unless there are compelling reasons to do so, as in June 2013 when data from September 1991 to June 2006 was revised (for more information on this recasting process, please see the feature article titled Recasting 20 years of ERP in the December quarter 2012 issue of Australian Demographic Statistics (cat. no. 3101.0).

For further information on ABS ERP, see the relevant Data Quality Statement.

Accuracy

Information on causes of death is obtained from a complete enumeration of deaths registered during a specified period and is not subject to sampling error. However, deaths data sources are subject to non-sampling error which can arise from inaccuracies in collecting, recording and processing the data.

Although it is considered likely that most deaths of Aboriginal and Torres Strait Islander (Indigenous) Australians are registered, a proportion of these deaths are not registered as Indigenous. Information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred and may differ from the self-identified Indigenous origin of the deceased.

All coroner certified deaths registered after 1 January 2006 are now subject to a revisions process. For the 2016 Report, 2007, 2008, 2009, 2010 and 2011 data are final, 2012 data are revised and 2013 data are preliminary. Data for 2012 and 2013 are subject to revisions. Prior to 2006 all ABS processing of causes of death data for a particular reference period was finalised approximately 13 months after the end of the reference period. Where insufficient information was available to code a cause of death (e.g. a coroner certified death was yet to be finalised by the Coroner), less specific ICD codes were assigned as required by the ICD coding rules. The revision process enables the use of additional information relating to coroner certified deaths, as it becomes available over time. This results in increased specificity of the assigned ICD-10 codes.

Revisions will only impact on coroner certified deaths, as further information becomes available to the ABS about the causes of these deaths. See Technical Note: Causes of Death Revisions 2010 and 2011 in Causes of Death, Australia, 2012 (Cat.no. 3303.0).

In November 2010, the Queensland Registrar of Births, Deaths and Marriages advised the ABS of an outstanding deaths registration initiative undertaken by the Registry. This initiative resulted in the November 2010 registration of 374 previously unregistered deaths which occurred between 1992 and 2006 (including a few for which a date of death was unknown). Of these, around three-quarters (284) were deaths of Aboriginal and Torres Strait Islander Australians.

The ABS discussed different methods of adjustment of Queensland death registrations data for 2010 with key stakeholders. Following the discussion, a decision was made by the ABS and key stakeholders to use an adjustment method that added together deaths registered in 2010 for usual residents of Queensland which occurred in 2007, 2008, 2009 and 2010. This method minimises the impact on mortality indicators used in various government reports. However, care should still be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010. Please note that there are differences between data output in the Causes of Death, Australia, 2010 publication (Cat. no. 3303.0) and 2010 data reported for COAG, as this adjustment was not applied in the publication. For further details see Technical Note: Registration of outstanding deaths, Queensland 2010, from the Deaths, Australia, 2010 publication (Cat. no, 3302.0) and Explanatory Note 103 in the Causes of Death, Australia, 2010 publication (Cat. no. 3303.0).

Investigation conducted by the WA Registrar of Births, Deaths and Marriages indicated that some deaths of non-Indigenous people were wrongly identified as deaths of Indigenous people in WA for 2007, 2008 and 2009. The ABS discussed this issue with a range of key stakeholders and users of Aboriginal and Torres Strait Islander deaths statistics. Following this discussion, the ABS did not release WA Aboriginal and Torres Strait Islander deaths data for the years 2007, 2008 and 2009

28

in the 2010 issue of Deaths, Australia publication, or in the 2011 COAG data supply. The WA Registry corrected the data and resupplied the corrected data to the ABS. These corrected data were then released by the ABS in spreadsheets attached to *Deaths, Australia, 2010* (Cat. no. 3302.0) publication on 24 May 2012, and were included in the 2013 and subsequent RoGS. In addition, 3 deaths in WA for 2009 which were wrongly coded as deaths of Indigenous people were corrected as deaths of non-indigenous people in a previous RoGS.

All ERP data sources are subject to non-sampling error. Non-sampling error can arise from inaccuracies in collecting, recording and processing the data. In the case of Census and Post Enumeration Survey (PES) data, every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. The ABS does not have control over any non-sampling error associated with births, deaths and migration data. For more information see the *Demography Working Paper 1998/2 - Quarterly birth and death estimates, 1998* (Cat. no. 3114.0). and *Australian Demographic Statistics* (Cat. no. 3101.0).

Non-Indigenous estimates are available for census years only. In the intervening years, Indigenous population projections are based on assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. Non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012 and 2013 are preliminary estimates.

Non-Indigenous data from the Causes of Death collection do not include death registrations with a 'not stated' Indigenous status.

Some rates are unreliable due to small numbers of deaths over the reference period. Resultant rates could be misleading, for example, where the non-Indigenous mortality rate is higher than the indigenous mortality rate. Age-standardised death rates based on a very low death count have been deemed unpublishable. Some cells have also not been published to prevent back-calculation of these suppressed cells. Caution should be used when interpreting rates for this indicator.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice.

Accessibility

Causes of death data are available in a variety of formats on the ABS website under the 3303.0 product family. ERP data is available in a variety of formats on the ABS website under the 3101.0 and 3201.0 product families. Further information on deaths and mortality may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

Data for this indicator have been age-standardised, using the direct method, to 'under 75 years' of age. Direct age-standardisation to the 2001 total Australian population was used (see Data Cube: Standard Population for Use in Age-Standardisation Table in Australian Demographic Statistics, Dec 2013 (Cat. no. 3101.0)). Age-standardised results provide a measure of relative difference only between populations.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on potentially avoidable deaths.
- A large number of unregistered deaths in Queensland dating back to 1992 were identified and registered in 2010. Care should be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010.
- Data by Indigenous status are reported for NSW, Queensland, WA, SA and the NT. Only these jurisdictions have evidence of a sufficient level of Indigenous identification, have sufficient numbers of Indigenous deaths and do not have significant data quality issues.

• Data are of acceptable accuracy. Although most deaths of Indigenous Australians are registered, it is likely that some are not identified as Indigenous. Therefore data are likely to underestimate the Indigenous mortality rate. Rates should be used with caution.

Mortality and life expectancy

Life expectancy

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Mortality and life expectancy — Life expectancy

Measure/s (computation)

Life tables for the Australian population, from which life expectancy at birth is obtained. Age/sex-specific death rates used in the construction of the life tables are

calculated as follows.

Numerator: death registrations for 2012-2014 provided by State and Territory

Registrars of Births, Deaths and Marriages.

Denominator: Estimated resident population (ERP) for the period 2012–2014.

Data source/s Life Tables, States, Territories and Australia, 2012-2014 (Cat. no. 3302.0.55.001)

Data Quality Framework Dimensions

Institutional environment

For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

Death statistics are sourced from death registrations systems administered by the various State and Territory Registrars of Births, Deaths and Marriages. It is a legal requirement of each State and Territory that all deaths are registered. Information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred.

Relevance

Life tables based on assumed improvements in mortality are produced by the ABS using assumptions on future life expectancy at birth, based on recent trends in life expectancy. These life tables are not published by the ABS, they are used as inputs into ABS population projections.

The life tables are current or period life tables, based on death rates for a short period of time during which mortality has remained much the same. Mortality rates for the Australian and state and territory life tables are based on death registrations and estimated resident population for the period 2011–2013. The life tables do not take into account future assumed improvements in mortality.

Life tables are presented separately for males and females. The life table depicts the mortality experience of a hypothetical group of newborn babies throughout their entire lifetime. It is based on the assumption that this group is subject to the age-specific mortality rates of the reference period. Typically this hypothetical group is 100 000 in size.

Timeliness

ABS estimates of all Australian life expectancy at birth are calculated for a 3 year period and published on an annual basis.

Accuracy

Compilation of life tables requires complete and accurate data on deaths that occur in a period, and reliable estimates of the population exposed to the risk of dying during that period. These data are required by age and sex so as to calculate age-sex specific death rates.

Information on deaths is obtained from a complete enumeration of deaths registered during a specified period and are not subject to sampling error. However, deaths data sources are subject to non-sampling error which can arise from inaccuracies in collecting, recording and processing the data.

Sources of non-sample error include:

- · completeness of an individual record at a given point in time;
- completeness of the dataset (eg impact of registration lags, processing lags and duplicate records);
- extent of coverage of the population (whilst all deaths are legally required to be registered, some cases may not be registered for an extended time, if at all); and
- lack of consistency in the application of questions or forms used by data providers, both through time and between different jurisdictions.

In November 2010, the Queensland Registry of Births, Deaths and Marriages registered 374 previously unregistered deaths which occurred between 1992 and 2006 (including a few for which a date of death was unknown). The ABS life tables are based on deaths by year of occurrence, and are therefore unaffected by this late registration of deaths.

Every effort is made to minimise error by working closely with data providers, the careful design of forms, training of processing staff, and efficient data processing procedures.

ERP is based on Census counts by place of usual residence, adjusted for net Census undercount and the number of Australian residents temporarily overseas on Census night, and backdated from the Census date to 30 June. For post-censal years, ERP is obtained by adding post-censal births, deaths and migrations to the Census ERP.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice.

Accessibility

ABS life expectancy estimates are published on the ABS website www.abs.gov.au (see *Life Tables, States, Territories and Australia, 2011–2013* (Cat. no. 3302.0.55.001).

Interpretability

Please view Explanatory Notes and Glossary that provide information on the data sources, terminology, classifications and other technical aspects associated with these statistics.

Data Gaps/Issues Analysis

Key data gaps /issues

- A large number of unregistered deaths in Queensland dating back to 1992 were identified and registered in 2010. Care should be taken when interpreting Indigenous death data for Queensland for 2010.
- Data are not available by socioeconomic status (SES). Disaggregation of this indicator by SES is a priority.
- The measure for this indicator is based on a three year average. Multiple year
 averages may not be able to determine trends over time as each reporting year
 incorporates the two previous years. Further work is required to determine what
 level of disaggregation is reliable for single year data.

Mortality rates — Infant and child

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Mortality rates — Infant and child

Measure/s (computation)

Numerators: number of death registrations for the period 2007-2012 (single years) provided by state and territory Registrars of Births, Deaths and Marriages, for:

- Infants children aged under 1 year
- Child 0-4 children aged 0 to 4 years

Denominators:

- Infants Number of live births in the period
- Child 0-4 Population aged 0 to 4 years

Data source/s

Numerators

• ABS Deaths Collection (3302.0)

Denominators

- Infants ABS Births Collection (3301.0)
- Child 0-4: ABS Population Projections (2011 Census based), (3222.0)
- Indigenous: ABS Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (2011 Census based), (3238.0)

Data Quality Framework Dimensions

Institutional environment

These collections are conducted under the *Census and Statistics Act 1905*. For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, see ABS Institutional Environment.

Relevance

Deaths data are published on an annual basis. The ABS Deaths collection includes any death which occurs in, or en route to Australia, including deaths of persons whose usual place of residence is overseas, and is registered with a state or territory Registry of Births, Deaths and Marriages. The ABS Deaths collection excludes still births/fetal deaths (these are accounted for in perinatal death statistics published in Causes of Death, Australia, cat. no. 3303.0) and deaths of Australian residents which occur outside Australia.

The ABS Births collection includes all births that are live born and have not been previously registered, births to temporary visitors to Australia, births occurring within Australian Territorial waters, births occurring in Australian Antarctic Territories and other external territories, births occurring in transit (i.e. on ships or planes) if registered in the state or territory of 'next port of call', births to Australian nationals employed overseas at Australian legations and consular offices and births that occurred in earlier years that have not been previously registered (late registrations). Births data exclude fetal deaths, adoptions, sex changes, legitimations and corrections, and births to foreign diplomatic staff, and births occurring on Norfolk Island.

Live births are products of conceptions, irrespective of duration of pregnancy, who, after being born, breathe or show any evidence of life such as a heartbeat.

For further information on the ABS Deaths and Births collections, see the relevant Data Quality Statements.

Timeliness

Death records are provided electronically to the ABS by individual Registrars on a monthly basis for compilation into aggregate statistics on a quarterly and annual basis. One dimension of timeliness in death registrations data is the interval between the occurrence and registration of a death. As a result, a small number of deaths occurring in one year are not registered until the following year or later.

Quarterly estimates of deaths on a preliminary basis are published five to six months after the reference period in *Australian Demographic Statistics* (cat. no. 3101.0), and revised 21 months after the end of each financial year. Annual estimates on a year of registration basis are published within eleven months of the end of the reference year in *Deaths, Australia* (cat. no. 3302.0).

Births records are provided electronically to the ABS by individual Registrars on a monthly basis for compilation into aggregate statistics on a quarterly and annual basis. Quarterly estimates of births on a preliminary basis are published five to six months after the reference period in *Australian Demographic Statistics* (cat. no. 3101.0), and revised 21 months after the end of each financial year. Annual estimates on a year of registration basis are published within ten months of the end of the reference year in *Births, Australia* (cat. no. 3301.0).

One dimension of timeliness in birth registrations data is the interval between the occurrence and registration of a birth. As a result, some births occurring in one year are not registered until the following year or even later. This can be caused by either a delay by the parent(s) in submitting a completed form to the registry, or a delay by the registry in processing the birth (for example, due to follow up activity due to missing information on the form, or resource limitations).

Preliminary ERP data is compiled and published quarterly and is generally made available five to six months after the end of each reference quarter. Every year, the 30 June ERP is further disaggregated by sex and single year of age, and is made available five to six months after end of the reference quarter. Commencing with data for September quarter 2006, revised estimates are released once more accurate births, deaths and NOM data becomes available. In the case of births and deaths, the revised data is compiled on a date of occurrence basis and is released 6-12months after the reference period. In the case of NOM, final data is based on actual traveller behaviour and is released 16 - 18 months after the reference period. Final estimates are made available every 5 years after a Census and revisions are made to the previous intercensal period. Generally ERP data is not changed once it has been finalised unless there are compelling reasons to do so, as in June 2013 when data from September 1991 to June 2006 was revised (for more information on this recasting process, please see the feature article titled Recasting 20 years of ERP in the December quarter 2012 issue of Australian Demographic Statistics (cat. no. 3101.0).

For further information on ABS Estimated Resident Population, see the relevant Data Quality Statement.

Accuracy

Information on births and deaths is obtained from a complete enumeration of births and deaths registered during a specified period and are not subject to sampling error. However, births and deaths data sources are subject to non-sampling error which can arise from inaccuracies in collecting, recording and processing the data. Sources of non-sampling error include completeness of an individual record at a given point in time, completeness of the dataset (e.g. impact of registration lags, processing lags and duplicate records), extent of coverage of the population (whilst all deaths are legally required to be registered, some cases may not be registered for an extended time, if at all) and lack of consistency in the application of questions or forms used by data providers, both through time and between different jurisdictions. Every effort is made to minimise error by working closely with data providers, the careful design of forms, training of processing staff, and efficient data processing procedures.

In June 2014, the New South Wales Registrar of Births, Deaths and Marriages (NSW Registry) transitioned to a new data processing system which resulted in temporary processing delays. These delays caused a number of birth records received by the NSW Registry in 2014 to be processed in 2015. As a result, the total number of births registered in New South Wales in 2014 (91 074) was 9388 (9.3 per cent) less than the number registered in 2013 (100 462).

The ABS, after discussions with the NSW Registry, is confident that the delayed registrations will be accounted for in 2015. For a more complete understanding of the births occurring in NSW for 2014 users should consult Table 13 in *Australian Demographic Statistics* (3301.0) which provides more up to date information about births in 2014 and 2015.

Analysis by the ABS showed that the distribution of important characteristics such as sex of child, age of mother, usual residence of mother and Indigenous status in 2014 data is similar to that in 2011-2013 data.

Concerns have previously been raised with the accuracy of the NSW births counts in recent years. In response to these concerns the ABS, in conjunction with the NSW Registry of Births, Deaths and Marriages, undertook an investigation which led to the identification of an ABS systems processing error. The ABS acknowledges that this has resulted in previous undercounts of births in NSW. Data for NSW and Australia were revised to include previously unprocessed NSW birth registrations for the period 2005 to 2011.

Although it is considered likely that most deaths of Aboriginal and Torres Strait Islander (Indigenous) Australians are registered, a proportion of these deaths are not registered as Indigenous. Information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred and may differ from the self-identified Indigenous origin of the deceased. Forms are often not subject to the same best practice design principles as statistical questionnaires, and respondent and/or interviewer understanding is rarely tested. Over-precise analysis of Indigenous deaths and mortality should be avoided.

In November 2010, the Queensland Registrar of Births, Deaths and Marriages advised the ABS of an outstanding deaths registration initiative undertaken by the Registry. This initiative resulted in the November 2010 registration of 374 previously unregistered deaths which occurred between 1992 and 2006 (including a few for which a date of death was unknown). Of these, around three-quarters (284) were deaths of Aboriginal and Torres Strait Islander Australians.

The ABS discussed different methods of adjustment of Queensland death registrations data for 2010 with key stakeholders. Following the discussion, a decision was made by the ABS and key stakeholders to use an adjustment method that added together deaths registered in 2010 for usual residents of Queensland which occurred in 2007, 2008, 2009 and 2010. This method minimises the impact on mortality indicators used in various government reports. However, care should still be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010. For further details see Technical Note: Registration of outstanding deaths, Queensland 2010, from *Deaths, Australia, 2010* (cat. no, 3302.0).

Investigation conducted by the WA Registrar of Births, Deaths and Marriages indicated that some deaths of non-Indigenous people were wrongly recorded as deaths of Indigenous people in WA for 2007, 2008 and 2009. The ABS discussed this issue with a range of key stakeholders and users of Aboriginal and Torres Strait Islander deaths statistics. Following this discussion, the ABS did not release WA Aboriginal and Torres Strait Islander deaths data for the years 2007, 2008 and 2009 in the 2010 issue of *Deaths, Australia*, or in the 2011 COAG data supply. The WA Registry corrected the data and resupplied the corrected data to the ABS. These corrected data were then released by the ABS in spreadsheets attached to Deaths, Australia, 2010 (cat. no. 3302.0) publication on 24 May 2012, and are included in this round of COAG reporting. In addition, 3 deaths in WA for 2009 which were wrongly coded as deaths of Indigenous people have been corrected as deaths of non-indigenous people in this round of COAG reporting.

All ERP data sources are subject to non-sampling error. Non-sampling error can arise from inaccuracies in collecting, recording and processing the data. In the case of Census and Post Enumeration Survey (PES) data every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. The ABS does not have control over any non-sampling error associated with births, deaths and migration data. For more information see the Demography Working Paper 1998/2 - Quarterly birth and death estimates, 1998 (cat. no. 3114.0) and Australian Demographic Statistics (cat. no. 3101.0). After each Census the ABS uses the Census population count to update the original series of published quarterly population estimates since the previous Census. For example, 2011 Census results were used to update quarterly population estimates between the 2006 and 2011 Census. The PES is conducted soon after the Census to estimate the number of residents not included in the Census. Factoring the PES results into determining the

ERP is a critical step in arriving at the most accurate determination of ERP possible. For more information on rebasing see the feature article in the December quarter 2012 issue of *Australian Demographic Statistics* (cat. no. 3101.0).

Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population projections are based on assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. For the current round of COAG reporting, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

Non-Indigenous data from the Deaths collection do not include death registrations with a 'not stated' Indigenous status.

Some rates are unreliable due to small numbers of deaths over the reference period. Resultant rates could be misleading for example where the non-Indigenous mortality rate is higher than the indigenous mortality rate. All rates in this indicator must be used with caution.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice.

The international standards and recommendations for the definition and scope of birth and deaths statistics in a vital statistics system are set out in the Principles and Recommendations for a Vital Statistics System Revision 2, published by the United Nations Statistical Division (UNSD). Consistent with the UNSD recommendations, the ABS defines:

- a birth as the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered liveborn.
- death as the permanent disappearance of all evidence of life at any time after live birth has taken place.

In addition, the UNSD recommends that the births and deaths to be counted include all deaths 'occurring in every geographic area and in every population group comprising the national area'. For the purposes of Australia, this includes all births and deaths occurring within Australia in 2012 as defined by the Australian Statistical Geography Standard (ASGS).

Registration of births and deaths is compulsory in Australia under relevant state/territory legislation. However, each state/territory Registrar has its own death registration form. Most data items are collected in all states and territories and therefore statistics at a national level are available for most characteristics. In some cases, different wording of questions asked on the registration form may result in different answers, which may affect final figures.

Use of the supporting documentation released with the statistics is important for assessing coherence within the dataset and when comparing the statistics with data from other sources. Changing business rules over time and/or across data sources can affect consistency and hence interpretability of statistical output.

Birth registrations data are not the only statistical series on births in Australia. The National Perinatal Data Collection (NPDC) is a national collection on pregnancy and childbirth, based on births reported to the Perinatal Data Collection in each state and territory in Australia. Midwives and other health professionals who attend births complete notification forms for each birth, using information obtained from mothers and hospital or other records. This information is compiled and published annually by the National Perinatal Statistics Unit (NPSU) of the Australian Institute of Health and

Welfare (AIHW) in Australia's Mothers and Babies. As information from these two collections are from different sources, the statistics obtained vary. The number of births in the Perinatal Data Collection are generally greater, which may reflect the likelihood of parent(s) to delay or fail to register the birth of a child.

Accessibility

Births data are available in a variety of formats on the ABS website under the 3301.0 product family. Deaths data are available in a variety of formats on the ABS website under the 3302.0 product family. ERP data is available in a variety of formats on the ABS website under the 3101.0 product family. Further information on births, deaths and mortality may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

Births statistics are generally straightforward and easy to interpret. It should be noted, however, that changes in numbers of births over time can be due to two factors: changes in fertility, and changes in the number of women in child-bearing ages. For this reason, births data need to be considered in relation to the size of the relevant population(s) through the use of fertility rates. Another aspect that may be overlooked is plurality, or the fact that each birth of a multiple birth is counted individually in births data.

Deaths statistics are generally straightforward and easy to interpret. It should be noted, however, that changes in numbers of deaths over time can be due a number of factors including changes in mortality and changes in the size and age/sex structure of the population. For this reason, deaths data needs to be considered in relation to the size of the relevant population(s) through the use of mortality rates.

Information of mortality rates, as well as data sources, terminology, classifications and other technical aspects associated with death statistics can be found in *Deaths Australia* (cat.no 3302.0) in the Explanatory Notes, Appendices and Glossary on the ABS website.

ERP is generally easy to interpret as the official measure of Australia's population (by state and territory) on a place of usual residence basis. However, there are still some common misconceptions. For example, a population estimate uses the term 'estimate' in a way which differs from the words' common use. Generally the term estimate is used to describe a guess, or approximation. Demographers mean that they apply the demographic balancing equation by adding births, subtracting deaths and adding the net of overseas and interstate migration to a base population. Each of the components of ERP is subject to error, but ERP itself is not in any way a guess. It is what the population would be if the components are measured well.

Population estimation is also very different to sample survey-based estimation. This is because population estimation is largely based on a full enumeration of components. In the case of the population base, only the PES used sampled data to adjust for census net undercount. In the case of the components of population growth used to carry population estimates forward, Australia has a theoretically complete measure of each component.

Another example of a common misconception relates to the fact that the population projections are not predictions or forecasts. They are an assessment of what would happen to Australia's population if the assumed levels of different components of population change - births, deaths and migration - were to hold into the future.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on infant (<1 year) and child (0–4 years) mortality rates.
- Data are of acceptable accuracy. Although most deaths of Indigenous Australians are registered, it is likely that some are not identified as Indigenous. Therefore data are likely to underestimate the Indigenous mortality rate.
- A large number of unregistered deaths in Queensland dating back to 1992 were identified and registered in 2010. Care should be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010.
- Data by Indigenous status are reported for NSW, Queensland, WA, SA and the NT only. Only these jurisdictions have evidence of a sufficient level of Indigenous identification, have sufficient numbers of Indigenous deaths and do not have

significant data quality issues.

- Variability bands provided with rates describe the range of potential results for mortality rates. Variability bands are calculated for single-year and aggregate years data by State and Territory (for within jurisdiction comparisons only — they cannot be used to make comparisons across jurisdictions).
- Further work is required to improve the completeness of Indigenous identification for registered deaths.

Mortality rates by major cause of death

Data quality information for this indicator has been sourced from the Australian Bureau of Statistics (ABS) with additional Steering Committee comments.

Indicator definition and description

Indicator

Age standardised mortality by major cause of death

Measure/s (computation)

Numerator

• Death registrations by major cause of death.

Denominators

- Estimated Resident Population (ERP)
- Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians

Data source/s

Numerator: ABS Causes of Death collection (Cat. no. 3303.0)

Denominators:

- ABS ERP (Cat. no. 3101.0)
- ABS Estimates and Projections, Aboriginal and Torres Strait Islander Australians (Cat. no. 3238.0), Series B.
- For the non-Indigenous population, the projected Indigenous population (3238.0, Series B) is subtracted from the ABS 2011 Census-based ERP.

Data Quality Framework Dimensions

Institutional environment

These collections are conducted under the *Census and Statistics Act 1905*. For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, see ABS Institutional Environment.

Relevance

The ABS Causes of Death collection includes all deaths that occurred and were registered in Australia, including deaths of persons whose usual residence is overseas. Deaths of Australian residents that occurred outside Australia may be registered by individual Registrars, but are not included in ABS deaths or causes of death statistics.

Data in the Causes of Death collection include demographic items, as well as causes of death information, which is coded according to the International Statistical Classification of Diseases and Related Health Problems (ICD). ICD is the international standard classification for epidemiological purposes and is designed to promote international comparability in the collection, processing, classification, and presentation of causes of death statistics. The classification is used to classify diseases and causes of disease or injury as recorded on many types of medical records as well as death records The ICD has been revised periodically to incorporate changes in the medical field. The 10th revision of ICD (ICD-10) has been used by the ABS to code cause of death since 1997.

For further information on the ABS Causes of Death collection, see the relevant Data Quality Statement.

Timeliness

Death records are provided electronically to the ABS by individual Registrars and the National Coroners Information System (NCIS) on a monthly basis, for compilation into aggregate statistics on an annual basis. One dimension of timeliness in causes of death registrations data is the interval between the occurrence and registration of a death. As a result, a small number of deaths occurring in one year are not registered until the following year or later.

Preliminary ERP data is compiled and published quarterly and is generally made available five to six months after the end of each reference quarter. Every year, the 30 June ERP is further disaggregated by sex and single year of age, and is made available five to six months after the end of the reference quarter. Commencing with data for September quarter 2006, revised estimates are released annually and made available 21 months after the end of the reference period for the previous financial

year, once more accurate births, deaths and net overseas migration data becomes available. In the case of births and deaths, the revised data is compiled on a date of occurrence basis. In the case of net overseas migration, final data is based on actual traveller behaviour. Final estimates are made available every 5 years after a Census and revisions are made to the previous intercensal period. Generally ERP data is not changed once it has been finalised unless there are compelling reasons to do so, as in June 2013 when data from September 1991 to June 2006 was revised (for more information on this recasting process, please see the feature article titled Recasting 20 years of ERP in the December quarter 2012 issue of *Australian Demographic Statistics* (Cat. no. 3101.0).

For further information on ABS Estimated Resident Population, see the relevant Data Quality Statement.

Accuracy

Information on causes of death is obtained from a complete enumeration of deaths registered during a specified period, so is not subject to sampling error. However, causes of death data sources are subject to non-sampling error which can arise from inaccuracies in collecting, recording and processing the data.

Although it is considered likely that most deaths of Aboriginal and Torres Strait Islander (Indigenous) Australians are registered, a proportion of these deaths are not registered as Indigenous. Information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred and may differ from the self-identified Indigenous origin of the deceased. Forms are often not subject to the same best practice design principles as statistical questionnaires, and respondent and/or interviewer understanding is rarely tested. Over-precise analysis of Indigenous deaths and mortality should be avoided.

All coroner certified deaths registered after 1 January 2006 are now subject to a revisions process. In this round of COAG reporting, 2008, 2009 and 2010 data are final, 2011 data are revised and 2012 data are preliminary. Data for 2011 and 2012 are subject to further revisions. Prior to 2006 all ABS processing of causes of death data for a particular reference period was finalised approximately 13 months after the end of the reference period. Where insufficient information was available to code a cause of death (e.g. a coroner certified death was yet to be finalised by the Coroner), less specific ICD codes were assigned as required by the ICD coding rules. The revision process enables the use of additional information relating to coroner certified deaths, as it becomes available over time. This results in increased specificity of the assigned ICD-10 codes.

Revisions will only impact on coroner certified deaths, as further information becomes available to the ABS about the causes of these deaths. See Technical Note: Causes of Death Revisions 2010 and 2011 in Causes of *Death, Australia, 2012* (Cat. no. 3303.0).

In November 2010, the Queensland Registrar of Births, Deaths and Marriages advised the ABS of an outstanding deaths registration initiative undertaken by the Registry. This initiative resulted in the November 2010 registration of 374 previously unregistered deaths which occurred between 1992 and 2006 (including a few for which a date of death was unknown). Of these, around three-quarters (284) were deaths of Aboriginal and Torres Strait Islander Australians.

The ABS discussed different methods of adjustment of Queensland death registrations data for 2010 Following the discussion, a decision was made by the ABS and key stakeholders to use an adjustment method that added together deaths registered in 2010 for usual residents of Queensland which occurred in 2007, 2008, 2009 and 2010. This method minimises the impact on mortality indicators used in various government reports. However, care should still be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010. Please note that there are differences between data output in the Causes of Death, Australia, 2010 publication (cat. No. 3303.0) and 2010 data reported for COAG, as this adjustment was not applied in the publication. For further details see Technical Note: Registration of outstanding deaths, Queensland 2010, from Deaths, Australia, 2010 (Cat. no. 3302.0) and Explanatory Note 103 in the Causes of Death, Australia, 2010 (Cat. no. 3303.0).

Investigation conducted by the WA Registrar of Births, Deaths and Marriages indicated that some deaths of non-Indigenous people were wrongly recorded as

deaths of Indigenous people in WA for 2007, 2008 and 2009. The ABS discussed this issue with a range of key stakeholders and users of Aboriginal and Torres Strait Islander deaths statistics. Following this discussion, the ABS did not release WA Aboriginal and Torres Strait Islander deaths data for the years 2007, 2008 and 2009 in the 2010 issue of Deaths, Australia publication, or in the 2011 COAG data supply. The WA Registry corrected the data and resupplied the corrected data to the ABS. These corrected data were then released by the ABS in spreadsheets attached to *Deaths, Australia, 2010* (ABS, 2011) publication on 24 May 2012, and are included in this round of COAG reporting. In addition to that, 3 deaths in WA for 2009 which were wrongly coded as deaths of Indigenous people have been corrected as deaths of non-indigenous people in this round of COAG reporting.

All ERP data sources are subject to non-sampling error. Non-sampling error can arise from inaccuracies in collecting, recording and processing the data. In the case of Census and Post Enumeration Survey (PES) data every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. The ABS does not have control over any non-sampling error associated with births, deaths and migration data. For more information see the *Demography Working Paper 1998/2 - Quarterly birth and death estimates, 1998* (Cat. no. 3114.0) and *Australian Demographic Statistics* (Cat. no. 3101.0).

Non-Indigenous estimates are available for census years only. In the intervening years, Indigenous population projections are based on assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. In the present tables, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

Non-Indigenous data from the Causes of Death collection do not include death registrations with a 'not stated' Indigenous status.

Some rates are unreliable due to small numbers of deaths over the reference period. Resultant rates could be misleading, for example, where the non-Indigenous mortality rate is higher than the indigenous mortality rate. Age-standardised death rates based on a very low death count have been deemed unpublishable. Some cells have also not been published to prevent back-calculation of these suppressed cells. Caution should be used when interpreting rates for this indicator.

Mortality rates for neoplasms may differ compared to individual State and Territory Cancer Registry mortality rates due to different sources of death data being used to calculate these rates. ABS mortality data is the cause of death data used for this indicator.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice.

Accessibility

Causes of death data are available in a variety of formats on the ABS website under the 3303.0 product family. Further information on deaths and mortality may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

Data for all deaths in this indicator have been age-standardised, using the direct method, to 85 years +. Data for Indigenous deaths in this indicator have been age-standardised, using the direct method, to 75 years + to account for differences between the age structures of the Indigenous and non-Indigenous populations. Direct age-standardisation to the 2001 total Australian population was used (see Data Cube: Standard Population for Use in Age-Standardisation Table in Australian Demographic Statistics, Dec 2013 (Cat. no. 3101.0)). Age-standardised results provide a measure of relative difference only between populations.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on major causes of death. Data are available for all states and territories, and by Indigenous status for selected jurisdictions. Data are not available by socioeconomic status (SES).
- A large number of unregistered deaths in Queensland dating back to 1992 were identified and registered in 2010. Care should be taken when interpreting Aboriginal and Torres Strait Islander death data for Queensland for 2010.
- Data by Indigenous status are reported for NSW, Queensland, WA, SA and the NT. Only these jurisdictions have evidence of a sufficient level of Indigenous identification, have sufficient numbers of Indigenous deaths and do not have significant data quality issues.
- Data are of acceptable accuracy. Although most deaths of Indigenous Australians are registered, it is likely that some are not identified as Indigenous. Therefore data are likely to underestimate the Indigenous mortality rate. Rates should be used with caution.
- Variability bands provided with rates describe the range of potential results for mortality rates. Variability bands are calculated for single-year and aggregate years data by State and Territory (for within jurisdiction comparisons only — they cannot be used to make comparisons across jurisdictions).
- Further work is required to improve the completeness of Indigenous identification for registered deaths.

Employed health practitioners

Data quality information for this indicator has been sourced from the Australian Institute of Health and Welfare (AIHW) with additional Steering Committee comments.

Indicator definition and description

Indicator Employed health practitioners

Measure/s (computation)

Full time equivalent employed health practitioners per 100 000 population (by age

group).

Age profiles are reported for employed nursing and midwifery, medical, and allied health practitioners. Data show the numbers of each of these registered professions

in ten year age brackets, both by jurisdiction and by region.

Data source/s National Health Workforce Data Set: medical practitioners 2014.

National Health Workforce Data Set: nurses and midwives 2014.

National Health Workforce Data Set: allied health practitioners 2014.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator using estimates derived from the National Health Workforce Data Set (NHWDS). The NHWDS is developed through the collaboration of three agencies.

The Australian Health Practitioner Regulation Agency (AHPRA) is the organisation responsible for the implementation of the National Registration and Accreditation Scheme (NRAS) across Australia, including collecting registration data and administering the workforce surveys.

Health Workforce Australia was responsible for the development of the health workforce surveys until its closure by the Australian Government on 6 August 2014. The Australian Government Department of Health now performs this function.

The AIHW receives registration and survey data from the AHPRA. The registration and workforce survey data are combined, cleansed and adjusted for non-response to form the NHWDS, and the findings reported by profession. AIHW is the data custodian of the NHWDS. These data are used for workforce planning, monitoring and reporting.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister. For further information, see the AIHW website.

Relevance

Medical practitioners, nurses/midwives and nominated allied health practitioners are required by law to be registered with their relevant national board to practise in Australia. All medical practitioners, nurses/midwives and nominated allied health practitioners must complete the formal registration renewal form(s) to practise in Australia. This is the compulsory component of the renewal process. The exception is Aboriginal and Torres Strait Islander health practitioners in the allied health workforce; where those who are not required by their employer to use the title 'Aboriginal and Torres Strait Islander health practitioner', 'Aboriginal health practitioner' or 'Torres Strait Islander health practitioner' are not required to be registered, and can continue to work using their current titles (e.g. 'Aboriginal health worker', 'drug and alcohol worker' and 'mental health worker'). Practitioners in some allied health professions are not required to be registered and are not included in the NHWDS.

The health workforce surveys for each of these professions is voluntary and only practitioners who renew their registration receive a questionnaire for completion. New registrants will not receive a survey form until they renew their registration the following year, during the registration renewal period. Practitioners with limited registration are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year.

National Health Workforce Data Set: medical practitioners 2010, 2011, 2012, 2013 and 2014

• The NHWDS: medical practitioners 2010, 2011, 2012, 2013 and 2014 contain registration details of all registered medical practitioners in Australia, at 30 September on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data of respondents obtained from the Medical Workforce Survey (with the exception for 2010 of those whose principal state of practice was Queensland or Western Australia, as not all registrations in these states expired prior to the national registration deadline for that year).

National Health Workforce Data Set: nurses and midwives 2011, 2012, 2013 and 2014

• The NHWDS: nurses and midwives 2011, 2012 and 2013 contain registration details of all registered nurses/midwives in Australia at 31 May on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data of respondents obtained from the Nursing and Midwifery Workforce Survey.

National Health Workforce Data Set: allied health practitioners 2012, 2013 and 2014.

- The NHWDS: allied health practitioners 2012, 2013 and 2014 contain registration details of all registered allied health practitioners in Australia, at 30 November on the annual renewal date. Data were extracted from the AHPRA database at the end of January the following year. The NHWDS also contains workforce data obtained from each profession-specific health workforce survey.
- Dental practitioner workforce data for 2014 are part of the NHWDS: allied health practitioners 2014 (for previous years, a stand-alone NHWDS). However, for the purposes of this indicator, allied health practitioners data exclude dental practitioners.
- Allied health professions not in the National Registration and Accreditation S
 cheme are not included in the data set (e.g. sonographers and optical
 technicians).
- Indicator data for allied health practitioners are comparable between 2013 and 2014. The same professions were included in both years.
- Indicator data for allied health practitioners are not comparable between 2012 and 2013
 - due to transitional arrangements with the migration of data from state and territory-based systems to NRAS, in 2012, many medical radiation practitioners in Queensland, WA and Tasmania were not required to renew their registrations and, as a result did not complete a workforce survey. As a consequence, data for Queensland, WA and Tasmania for this profession are excluded from the indicator data for allied health practitioners.
 - for the same reason, occupational therapists in Queensland, WA and SA are excluded from the indicator data for allied health practitioners in 2012.
- Dental practitioner workforce data for 2014 are part of the NHWDS: allied health practitioners 2014. Dental practitioner workforce data were a stand-alone NHWDS for previous years (see below). For the purposes of this indicator, dental practitioner workforce data are for dentists only the other 4 practitioner types in the NHWDS are excluded (dental hygienists, dental prosthetists, dental therapists and oral health therapists; dental practitioners may register in more than 1 practitioner type, resulting in double counting of practitioners).
 - The NHWDS: dental practitioners 2011, 2012 and 2013 contain registration details of all registered dental practitioners in Australia, at 30 November on the annual renewal date. Data were extracted from the AHPRA database at the end of January the following year. In 2011, 2012 and 2013, the NHWDS also contains workforce data obtained from the Dental Workforce Survey.

Timeliness

National Health Workforce Data Set:

 The NHWDS for each of the registered professions will be produced annually during the national registration renewal process. Each profession will also be administered a Workforce Survey as part of the registration renewal process.

- Medical practitioners 2010, 2011, 2012, 2013 and 2014
 - The NHWDS: medical practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 July and 30 September each year, including the collection of the Medical Workforce Survey. Queensland and WA were excluded from data for 2010 as not all registrations in these states expired prior to the national registration deadline for that year, despite extension of the renewal process.
- Nurses and midwives 2011, 2012, 2013 and 2014
 - The NHWDS: nurses and midwives is produced annually from information collected by the national registration renewal process, conducted between 1 April and 31 May each year, including the collection of the Nursing and Midwifery Workforce Survey. The renewal process for 2011 was extended for Queensland (to the end of June 2011) and WA (end of December 2011) registrants.
- Allied health practitioners 2012, 2013 and 2014
 - The NHWDS: allied health practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 September and 30 November each year, including the collection of the profession-specific workforce surveys. Practitioners with limited registration are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year.

Accuracy

Data manipulation and estimation processes

- The registration and workforce survey data for each health profession are combined, cleansed and adjusted for non-response to form the NHWDS. The cleaning and editing procedures included range and logic checks, clerical scrutiny at unit record level, and validation of unit record and aggregate data.
- Imputation methods are used to account for item non-response and survey non-response. In 2013, the methodology for survey non-response was changed from a weighting-based methodology to a randomised sequential hot deck-based imputation.
 - It should be noted that both of these kinds of non-response is likely to introduce some bias in the estimates and any bias is likely to become more pronounced when response rates are low or when estimates are based on a small number of records. Care should be taken when drawing conclusions about the size of the differences between estimates.
- As a result of the estimation method to adjust for non-response, numbers of medical practitioners, dental practitioners, nurses/midwives or allied health practitioners may have been in fractions, but have been rounded to whole numbers for this indicator. The full-time equivalent (FTE) rate calculations are based on rounded numbers.

Registration data from the National Registration and Accreditation Scheme (NRAS)

- Registration details were migrated from the respective state and territory professional board (or council) for practitioners with registrations expiring after the official AHPRA closing date for their profession.
- Some data items previously collected by the AIHW Labour Force Surveys are now collected by the NRAS. However, some data quality issues due to migrated data items from the respective state and territory health profession boards may have affected the weighting method.
- Medical practitioners, nurses/midwives and allied health practitioners who reside overseas have been included with practitioners whose state or territory of principal practice and state or territory of main job, respectively, could not be determined.

Health Workforce Survey

- From 2013, the online survey questionnaire includes electronic sequencing of questions to automatically guide the respondent to the next appropriate question based on previous responses to questions.
- For the online survey questionnaire prior to 2013, and the paper version of the questionnaire, respondents may have made inconsistent responses by not correctly following the sequencing instructions.

• The order of the response categories for some questions may have also impacted on the accuracy of the information captured. In addition, there was variation in some responses between the online and paper surveys.

NHWDS data by profession

The following should be noted when comparing state and territory indicator data:

- The data include employed professionals who did not state or adequately describe their state of principal practice and employed professionals who reside overseas. The national estimates include this group.
- National Health Workforce Data Set: medical practitioners 2010, 2011, 2012, 2013 and 2014
 - The overall response rate for 2010 (excluding Queensland and Western Australia) was 76.6 per cent.
 - The overall response rate for 2011 was 85.3 per cent.
 - The overall response rate for 2012 was 90.1 per cent.
 - The overall response rate for 2013 was 88.6 per cent
 - The overall response rate for 2014 was 91.8 per cent.
- National Health Workforce Data Set: nurses and midwives 2011, 2012, 2013 and 2014
 - The overall response rate for 2011 was 85.1 per cent.
 - The overall response rate for 2012 was 93.3 per cent.
 - The overall response rate for 2013 was 87.6 per cent
 - The overall response rate for 2014 was 93.4 per cent.
- National Health Workforce Data Set: allied health practitioners 2013 and 2014
 - The overall response rate for 2013 was 87.9 per cent
 - The overall response rate for 2014 was 92.9 per cent (excluding dental pracitioners).

Coherence

Health Workforce Survey — coherence with previous surveys

- Labour force data published by the AIHW before the NRAS was established in July 2010 were the result of collated jurisdiction-level occupation-specific surveys. The current Health Workforce Survey gathers similar information from each professional group through a separate questionnaire, tailored slightly to take account of profession-specific responses to certain questions, e.g. work setting of main job.
- For this indicator, the workforce surveys for medical practitioners, dental practitioners, nurses/midwives and allied health practitioners collect similar data items, but the methodology differs from previous years. The AHPRA is now the single source of registered practitioner data instead of eight state and territories bodies for each profession, and there is greater consistency between jurisdictions and years in the scope of registration information.
- The scope and coverage of the Health Workforce Survey is also different from that of the previous series of AIHW Labour Force Surveys as not all jurisdictions surveyed all types of registered health practitioners.
- If the location of principal practice recorded in the registration data was different
 from the corresponding details of their main job self-reported by practitioners in
 the survey, the location was derived hierarchically based on main job information
 and then on principal practice location then place of residence.
- Date of birth is one of many data items previously collected by the AIHW Labour Force Surveys, which is now collected by the NRAS.
- The three employment-related questions in the new survey are now nationally consistent, but vary from the previous AIHW Labour Force Survey. Due to the differences in data collection (including survey design and questionnaire), processing and estimation methods, it is recommended that comparisons between workforce data from the NHWDS and the previous AIHW Labour Force Survey be made with caution.

AIHW Published Numbers — For this indicator, the rates are based on practitioners employed in the medical, allied health and nursing and midwifery workforces, which is consistent with data published in AIHW's workforce reports.

Accessibility

Published products available on the AIHW website include workforce reports, survey questionnaires, user guides to the data sets and supplementary detailed tables.

Interpretability

Explanatory information for the Medical Workforce Survey, Dental Workforce Survey and the Nursing and Midwifery Workforce Survey is contained in the published reports, supplementary detailed tables and data quality statements to the data set for each profession. For the allied health professions, information about their workforce surveys is available in the National Health Workforce Data Set: allied health practitioners data quality statement. This includes collection method, scope and coverage, survey response, imputation and weighting procedures, and assessment of data quality (including comparison with other data sources).

These are available via the AIHW website and readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator.

Data Gaps/Issues Analysis

Key data gaps /issues

- The rates have been calculated per 100 000 population for this indicator to assist with interpretation.
- Due to the differences in data collection, processing and estimation methods, including survey design and questionnaire, it is recommended that comparisons between workforce data from the National Health Workforce Data Set (NHWDS) and the previous AIHW Labour Force Survey be made with caution and noted in any analyses.
- Results for the indicator are estimates because the survey data have undergone
 imputation and weighting to adjust for non-response. It should be noted that any
 of these adjustments may have introduced some bias in the estimates and any
 bias is likely to become more pronounced when response rates are low or when
 estimates are based on a small number of survey records. Care should be taken
 when drawing conclusions about the size of the differences between estimates.
- The 2012, 2013 and 2014 medical and allied health practitioner indicator data exclude provisional registrants (there is no provisional registrant type for nurses and midwives).

10 Primary and community health

|---|-------|
| 10.2 Framework of performance indicators | 10.11 |
| 10.3 Key performance indicator results | 10.12 |
| 10.4 Future directions in performance reporting | 10.60 |
| 10.5 Definitions of key terms | 10.61 |
| 10.6 List of attachment tables | 10.63 |
| 10.7 References | 10.67 |

Attachment tables

Attachment tables are identified in references throughout this chapter by a '10A' prefix (for example, table 10A.1). A full list of attachment tables is provided at the end of this chapter, and the attachment tables are available on the website (www.pc.gov.au/rogs/2016).

This chapter reports on the performance of primary and community health services. Primary and community health services include general practice, pharmaceutical services, dentistry, allied health services, maternal and child health, alcohol and other drug treatment and other services. Primary and community health services aim to support and improve the health of Australians through the prevention of ill health as well as the detection and effective management of illness and injury — by direct service provision and/or referral to acute (hospital) or other healthcare services, as appropriate.

The scope of this chapter does not extend to:

- public hospital emergency departments and outpatient services (reported in chapter 11, 'Public hospitals')
- community mental health services (reported in chapter 12, 'Mental health management')
- Home and Community Care program services (reported in chapter 13, 'Aged care' and chapter 14, 'Services for people with disability').

Improvements to reporting on primary and community health services in this edition include:

- reporting of a new mini case study on a centralised, state-wide chronic disease management program in Queensland
- reporting a more complete measure of access to Pharmaceutical Benefits Scheme (PBS) medicines by location at a finer level of disaggregation
- reporting a 10 year time series for male general practitioners (GPs) (previously 5 years) as well as female GPs.

All abbreviations used in this Report are available in a complete list in volume A: Approach to performance reporting.

10.1 Profile of primary and community health

Roles and responsibilities

The primary and community health sector is the most frequently used part of Australia's healthcare system. Primary and community healthcare services are delivered by a range of health and allied health professionals in various private, not-for-profit and government service settings. General practice, pharmacy and community health services are funded largely by government, as are maternal and child health services. Governments also fund public dental and public alcohol and other drug treatment services. Allied health services and private dental services are largely non-government funded. Governments also fund programs to influence the supply, regional distribution and quality of primary and community health services. Primary Health Networks (PHNs) are an Australian Government funded national network of 31 independent primary health care organisations (replacing from 1 July 2015 the 61 Medicare Locals established under the National Health Reform agenda in 2011 and 2012). Their objective is to improve the efficiency and effectiveness of medical services, particularly for those at risk of poor health outcomes and to improve coordination of care to ensure patients receive the right care in the right place at the right time. Definitions for common health terms are provided in section 10.5.

General practice

General practice is a major provider of primary healthcare in Australia. It is defined by the Royal Australian College of General Practitioners (RACGP) as providing 'person centred, continuing, comprehensive and coordinated whole person health care to individuals and families in their communities' (RACGP 2014a). General practices are predominantly privately owned, by GPs or corporate entities.

GPs must be registered with the Medical Board of Australia. Most general practice data reported in this chapter are for services provided by those GPs who are recognised for Medicare — vocationally registered GPs and 'other medical practitioners' (OMP). GP services include preventative care and the diagnosis and treatment of illness and injury,

through direct service provision and/or referral to acute (hospital) or other healthcare services, as appropriate.

The Australian Government provides the majority of general practice income, through DHS Medicare — mainly as fee-for-service payments via the Medicare Benefits Schedule (MBS) — and the Department of Veterans Affairs (DVA). Additional Australian Government funding is provided to influence the supply, regional distribution and quality of general practice services, through initiatives such as the Practice Incentives Program (PIP) and PHNs (Australian Government DHS 2015). State and Territory governments also provide some funding for such programs, particularly in relation to regional distribution of general practices. The remainder comes mainly from insurance schemes and patient contributions.

Pharmaceutical services

The objective of the Australian Government funded PBS is to provide affordable, reliable and timely access to prescription medicines for all Australians. Around 80 per cent of prescription medicines are subsidised through the PBS (Department of Health 2010). Users make a co-payment — \$6.10 for concession card holders and up to \$37.70 for general consumers in 2015 — and the Australian Government pays the remaining cost of medicines eligible for the subsidy (Department of Health 2015). Co-payments are subject to a safety net threshold — \$1453.90 for general consumers and \$366.00 for concession card holders in 2015 — beyond which PBS medicines are generally cheaper or fully subsidised for the rest of the calendar year.

The Repatriation Pharmaceutical Benefits Scheme (RPBS) provides subsidised pharmaceutical medicines, dressings and other items to war veterans and war widows. The RPBS is administered by the DVA. Drugs eligible for subsidy under the RPBS may not be eligible under the PBS.

Dental services

Australia has a mixed system of public and private dental healthcare. State and Territory governments have the main responsibility for funding and delivery of major public dental programs, with public dental services primarily available to children and disadvantaged adults. The private sector receives funding to provide some public dental services, from the Australian Government through the DVA and the Dental Benefits Schedule, and from State and Territory governments through dental voucher systems. The Australian Government also supports private dental services through the private health insurance rebate.

Allied health services

Allied health services include, but are not limited to, physiotherapy, psychology, occupational therapy, audiology, podiatry and osteopathy. They are delivered mainly in the private sector. Some government funding of private allied health services is provided through insurance schemes and the private health insurance rebate. The Australian Government also makes some allied health services available under the MBS to patients with particular needs — for example, people with chronic conditions and complex care needs. Nationally in 2014, there were 25.0 FTE occupational therapists and 24.9 FTE psychologists per 100 000 people working in the public sector (table 10A.29).

Community health services

Community health services generally comprise multidisciplinary teams of health and allied health professionals and aim to protect and promote the health of particular communities who experience barriers that impede access to private sector primary and community health services. Governments (including local governments) provide services directly or indirectly through funding of service provision by a local health service or community organisation. There is no national strategy for community health services and there is considerable variation in the services provided across jurisdictions.

State and Territory governments are responsible for most community health services. Those serving Aboriginal and Torres Strait Islander communities are mainly the responsibility of the Australian Government (though State and Territory governments provide some funding). Of these Aboriginal and Torres Strait Islander primary healthcare services, around 60 per cent are community-controlled or managed — planned and governed by local Aboriginal and Torres Strait Islander communities. These services provide comprehensive primary health care and/or substance use, social and emotional wellbeing and mental health services. Tables 10A.111–10A.119 provide an outline of some of the community health programs targeting groups who face particular health issues, not elsewhere reported.

Maternal and child health

Maternal and child health services are funded by State and Territory governments. They provide services including: parenting support (including antenatal and postnatal programs); early childhood nursing programs; disease prevention programs (including childhood immunisations); and early intervention and treatment programs related to child development and health. Some jurisdictions also provide specialist programs through child health services, including hearing screening programs, and mothers and babies residential programs. Performance indicators for maternity services in public hospitals are reported in chapter 11 (Public hospitals).

Alcohol and other drug treatment

Alcohol and other drug treatment activities range from a brief intervention to long-term residential treatment. Types of treatment include detoxification, pharmacological treatment, counselling and rehabilitation.

Funding

In 2013-14, government recurrent expenditure on primary and community health services (excluding public health) was \$29.0 billion, of which State, Territory and local governments provided 23.7 per cent and the Australian Government 76.3 per cent (table 10.1).

Table 10.1 Estimated funding on primary healthcare, 2013-14 (\$ million)a, b

| | | Australian G | overnment | | | | | |
|-----------------------------|-------|--------------------------------------|-----------------|--------|--|---------------------|--------------------|---|
| | DVA | Department of Health and other | Premium rebates | Total | State, Territory and local government | Total government | Non- government | Total government and non- government |

a See table 10A.1 for detailed footnotes and caveats. b Totals may not add due to rounding. - Nil or rounded to zero.

Source: AIHW (Australian Institute of Health and Welfare) (2015), Health Expenditure Australia 2013-14, Cat. no. HWE 63; table 10A.1.

General practice

In 2014-15, 95.8 per cent of general practice encounters where a payment source was recorded were for services at least partly funded by Medicare or the DVA (Britt et al. 2015) (table 10A.2). Australian Government total recurrent expenditure on general practice in 2014-15 was \$8.3 billion or \$351 per person (table 10A.4). This includes fee-for-service expenditure through DHS Medicare and the DVA of \$7.7 billion (table 10A.3) — translating to \$328 per person (crude rate — not presented in table 10A.3) and accounting for 93.3 per cent of total recurrent expenditure — as well as expenditure on the Practice Incentives Program (PIP) and Medicare Locals. Age standardised fee-for-service expenditure per person data are presented in table 10A.3.

State and Territory governments contribute funding to general practice mainly through support programs such as assistance with housing and relocation, education programs and employment assistance for spouses and family members of doctors in rural areas. Non-government sources also contribute through insurance schemes (such as, workers compensation and third party insurance) and private individuals.

Pharmaceutical services

Australian Government expenditure through the PBS and RPBS on prescription medicines filled at pharmacies was around \$7.4 billion in 2014-15 (tables 10A.5 and 10A.6). Of this, around \$7.1 billion was through the PBS. Real expenditure on the PBS, which rose relatively steadily from \$6.9 billion (\$337 per person) in 2005-06 to a high of \$7.9 billion (\$350 per person) in 2011-12, decreased to \$7.1 billion (\$299 per person) in 2014-15 (figure 10.1 and table 10A.5). The proportion of PBS expenditure that is concessional fell from 80.0 to 77.4 per cent in the period 2005-06 to 2014-15 (table 10A.5).

The Australian Government also funds the supply of PBS medicines to Aboriginal and Torres Strait Islander primary healthcare services in remote and very remote areas under s.100 of the National Health Act 1953 (Cwlth), costing \$29.3 million in 2014-15 — a decline from \$38.1 million in 2012-13 (in 2014-15 dollars) (table 10A.7).

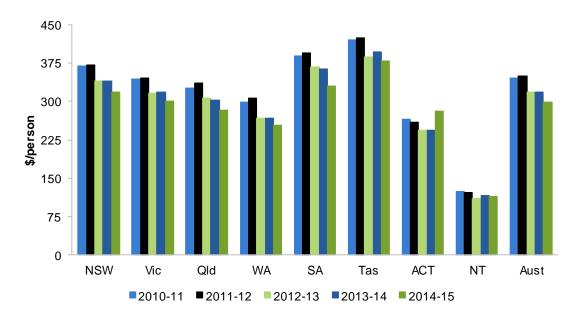

Figure 10.1 PBS expenditure (2014-15 dollars)^a

Source: Department of Health (unpublished) PBS Statistics; tables 10A.5 and 10A.6.

Dental services

Australian Government expenditure on dental services was \$1.3 billion in 2013-14, of which 48 per cent was through DVA and the Department of Health, and 52 per cent through private health insurance premium rebates (tables 10.1 and 10A.1). State, Territory and local government expenditure on dental services was \$713 million in 2013-14. Dental expenditure data by State and Territory are provided in table 10A.8.

Community health services

In 2013-14, government expenditure on community health services was \$7.4 billion, of which State, Territory and local governments provided 83.1 per cent and the Australian Government 16.9 per cent (tables 10.1 and 10A.1).

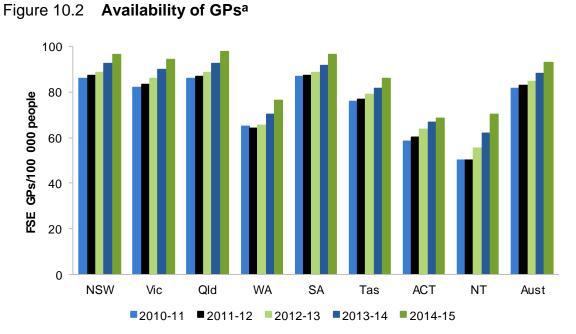

Australian Government expenditure on Aboriginal and Torres Strait Islander primary health care services was \$568 million in 2014-15 (table 10A.9).

^a See table 10A.5 for detailed footnotes and caveats.

Size and scope

General practice

There were 33 275 GPs — 22 005 on a Full Service Equivalent (FSE) basis — billing Medicare Australia, based on MBS claims data, in 2014-15 (see section 10.5 for a definition of FSE). This equated to 93.1 FSE GPs per 100 000 people. Rates have increased over the five year period reported, both nationally and for all jurisdictions (figure 10.2 and table 10A.10).

a See table 10A.10 for detailed footnotes and caveats.

Source: Department of Health (unpublished) MBS Statistics; table 10A.10.

Nationally, around 6242 general practitioner-type services per 1000 population were provided under DHS Medicare in 2014-15 (crude rate — not presented in table 10A.11). Age-standardised rates (ASR) increased across most jurisdictions over the four year period reported (figure 10.3).

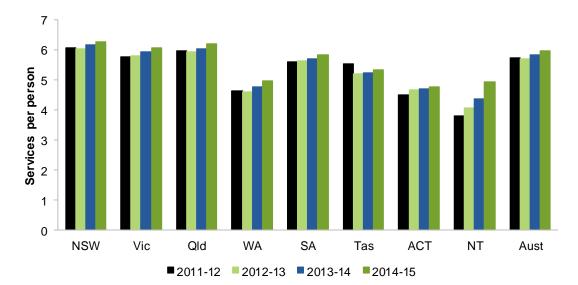

Figure 10.3 **GP type service use (ASR)**^a

Source: Department of Health (unpublished) MBS Statistics; DVA (unpublished) DVA data collection; ABS (unpublished) Australian demographic statistics, Cat. no. 3101.0; table 10A.11.

Pharmaceutical Benefits Scheme and Repatriation Pharmaceutical Benefits Scheme

Around 212 million services — 90.9 per cent of which were concessional — were provided under the PBS in 2014-15 (tables 10A.12 and 10A.13). This amounted to 8.9 filled prescriptions per person. A further 12 million services were provided under the RPBS in the same period.

Public dental services

All jurisdictions provide some form of public dental service for primary school children. Some jurisdictions also provide dental services to preschool and secondary school students.

State and Territory governments also provide some general dental services and a limited range of specialist dental services to disadvantaged adults who are holders of concession cards issued by Centrelink. Most jurisdictions provided public dental services in 2013-14 targeted to disadvantaged people. Current data are not available for use of public dental services for the 2016 Report.

a See table 10A.11 for detailed footnotes and caveats.

Community health services

There is no national data collection for community health services other than Aboriginal and Torres Strait Islander primary health care services. Of 203 Aboriginal and Torres Strait Islander primary healthcare services reported for 2013-14, 45.8 per cent were located in remote or very remote areas (table 10A.16). Of the 3.3 million episodes of healthcare provided in 2013-14 (table 10.2), around 46.8 per cent were provided in remote or very remote areas (table 10A.16).

Table 10.2 Estimated episodes of healthcare for Aboriginal and Torres
Strait Islander Australians by services for which OSR data
are reported ('000)^a

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|-------|
| 2009-10 | 542 | 185 | 379 | 409 | 192 | 36 | 26 | 622 | 2 391 |
| 2010-11 | 522 | 201 | 310 | 473 | 222 | 38 | 30 | 704 | 2 498 |

| 2012-13 | 622 | 238 | 575 | 583 | 217 | 53 | 38 | 743 | 3 068 |
| 2013-14 | 646 | 216 | 690 | 543 | 177 | 59 | 42 | 897 | 3 269 |

^a See table 10A.15 for detailed footnotes and caveats.

Source: AIHW (2015 and previous issues) Aboriginal and Torres Strait Islander health organisations: Online Services Report – key results, Cat. nos IHW 56, 79, 104, 139 and 152; table 10A.15.

As at 30 June 2014, the Aboriginal and Torres Strait Islander primary healthcare services reported employed around 4604 full time equivalent healthcare staff, of whom 54.0 per cent were Aboriginal and Torres Strait Islander people. In 2014, 7.3 per cent of employed doctors and 12.2 per cent of employed nurses/midwives were Aboriginal and Torres Strait Islander people (table 10A.19).

Alcohol and other drug treatment

Data for a total of 795 alcohol and other drug treatment agencies were reported for 2013-14, with 44.4 per cent identified as government providers and 55.6 per cent as non-government providers (table 10A.14). There were 180 713 reported closed treatment episodes in 2013-14 (table 10A.14) (see section 10.5 for a definition of a closed treatment episode). Clients seeking treatment for their own substance use (67.1 per cent of whom were male) accounted for 95.0 per cent of closed treatment episodes (table 10A.14). Nationally, alcohol was the most commonly reported principal drug of concern (40.5 per cent) — followed by cannabis (23.6 per cent), amphetamines (16.8 per cent) and heroin (7.0 per cent) — in closed treatment episodes for clients seeking treatment for their own substance use (AIHW 2015).

10.2 Framework of performance indicators

The performance indicator framework is based on common objectives for primary and community health (box 10.1).

Box 10.1 **Objectives for primary and community health**

Primary and community health services aim to support and improve the health of Australians by:

- providing a universally accessible point of entry to the healthcare system
- · promoting health and preventing illness
- providing timely and high quality healthcare that meets individual needs, throughout the lifespan directly, and/or by facilitating access to the appropriate service(s)
- coordinating service provision to ensure continuity of care where more than one service type, and/or ongoing service provision, is required to meet individuals' healthcare needs.

In addition, governments aim to ensure that interventions provided by primary and community health services are based on best practice evidence and delivered in an equitable and efficient manner.

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of primary and community health services (figure 10.4). The performance indicator framework shows which data are complete and comparable in the 2016 Report. For data that are not considered directly comparable, text includes relevant caveats and supporting commentary. Chapter 1 discusses data comparability and data completeness from a Report-wide perspective (see section 1.6).

In addition to section 10.1, the Report's statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

Availability of PBS medicines Equity of access to Availability of public Access Equity dentists Early detection and early treatment for Aboriginal and Child Torres Strait Islander immunisation Australians coverage Developmental health Objectives checks **Notifications** of selected Access Participation PERFORMANCE PBS medicines breast cancer Public dentistry screening waiting times GPs with vocational Participation registration General practices with Effectiveness screening accreditation Management of Influenza Appropriateness upper respiratory tract infection coverage for older people Chronic disease management Use of pathology tests and diagnostic imaging Electronic health information systems Safety Quality Responsiveness Patient satisfaction Continuity Cost to government Efficiency Sustainability of general practice per person Key to indicators* Outputs Outcomes Most recent data for all measures are comparable and complete Text Most recent data for at least one measure are comparable and complete Most recent data for all measures are either not comparable and/or not complete (Text) No data reported and/or no measures yet developed Text)

Figure 10.4 Primary and community health performance indicator framework

10.3 Key performance indicator results

Different delivery contexts, locations and client factors may affect the equity, effectiveness and efficiency of primary and community health services.

^{*} A description of the comparability and completeness of each measure is provided in indicator interpretation boxes within the chapter

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

Equity is defined for the purpose of this Report in terms of adequate access to government services for all Australians (see chapter 1, section 1.5).

Access — Availability of PBS medicines

'Availability of PBS medicines' is an indicator of governments' objective to provide equitable access to PBS medicines (box 10.2). Medicines are important in the treatment and prevention of illness. The availability of medicines is therefore a significant determinant of people's health and medicines should be available to those who require them, regardless of residential geolocation or socioeconomic circumstance.

Box 10.2 Availability of PBS medicines

'Availability of PBS medicines' is defined by three measures:

- access to PBS medicines by region, defined as the ABS census population divided by the number of approved providers of PBS medicines, by Pharmacy Access/Remoteness Index of Australia (PhARIA) area.
- PBS expenditure per person by region, defined as expenditure on PBS medicines, divided by the ERP, in urban and rural regions
- proportion of PBS prescriptions filled at a concessional rate, defined as the number of PBS prescriptions filled at a concessional rate, divided by the total number of prescriptions filled.

This indicator is difficult to interpret. A low or decreasing number of people per approved PBS provider may indicate greater availability of PBS medicines. High or increasing PBS expenditure per person may indicate improved availability of PBS medicines. A high or increasing proportion of PBS prescriptions filled at a concessional rate may indicate improved availability of PBS prescriptions to disadvantaged people. It is also important that there are not large discrepancies by region in these measures.

(continued next page)

Box 10.2 (continued)

This indicator does not provide information on whether the services are appropriate for the needs of the people receiving them.

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required data are available
 for all jurisdictions for 2015 for the measure access to PBS medicines by region and for
 2014-15 for the measures PBS expenditure per person by region and proportion of PBS
 prescriptions filled at a concessional rate.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Across Australia in the period 2011 to 2015, the number of people per pharmacy increased in urban areas (from 3777 to 3933) and decreased in rural areas (from 4108 to 3688) (table 10A.21). Taking into account the 21 medical practitioners and 160 Aboriginal and Torres Strait Islander primary health care services also approved to provide PBS medicines to the community in remote/very remote areas, there were 3065 people per PBS approved provider in rural areas in 2015 (figure 10.5 and table 10A.20).

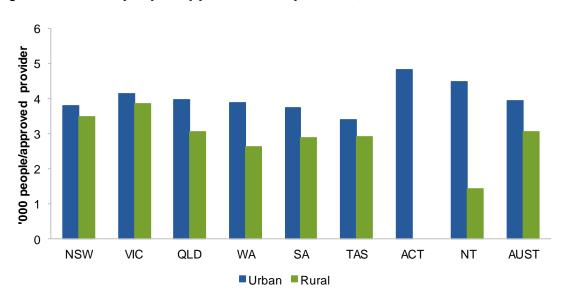

Figure 10.5 **People per approved PBS provider, 2014-15**a, b

Source: Department of Health (unpublished) derived from DHS Medicare, ABS (unpublished) 2011 Census of Population and Housing and the University of Adelaide's Australian Population and Migration Research Centre; table 10A.20.

a See box 10.2 and table 10A.20 for detailed definitions, footnotes and caveats. b The ACT has no rural areas under the classification used.

Nationally, PBS expenditure per person was highest in inner regional areas and lowest in remote/very remote areas (figure 10.6).

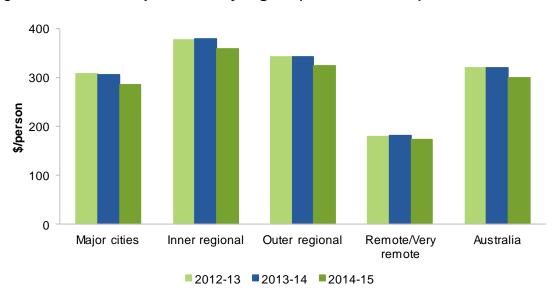

Figure 10.6 PBS expenditure by region (2014-15 dollars)^a

Access — Equity of access to GPs

'Equity of access to GPs' is an indicator of governments' objective to provide equitable access to primary healthcare services (box 10.3).

Box 10.3 Equity of access to GPs

'Equity of access to GPs' is defined by two measures:

- availability of GPs by region, defined as the number of FSE GPs per 100 000 people, by region
- availability of GPs by sex, defined as the number of FSE GPs per 100 000 population, by sex.

High or increasing availability of GPs can indicate improved access to GP services. Low availability of GPs by region can be associated with an increase in distance travelled and waiting times to see a GP, and increased difficulty in booking long consultations. Reduced competition for patients can also reduce bulk billing rates. State and Territory governments seek to influence the availability of GPs through incentives to recruit and retain GPs in rural and remote areas.

(continued next page)

^a See box 10.2 and table 10A.22 for detailed definitions, footnotes and caveats. *Source*: Department of Health (unpublished) PBS Statistics; table 10A.22.

Box 10.3 (continued)

High or increasing availability of GPs of each sex means it is more likely that patients who prefer to visit GPs of their own sex for discussion of health matters and to receive primary care will have their preference met. Low availability of GPs of each sex can be associated with increased waiting times to see a GP, for patients who prefer to visit GPs of their own sex.

This indicator does not provide information on whether people are accessing GP services or whether the services are appropriate for the needs of the people receiving them.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time but a break in time series
 means that data from 2012-13 are not comparable to data for previous years for the
 measure availability of GPs by region
- comparable (subject to caveats) across jurisdictions and over time for the measure availability of GPs by sex
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

In 2014-15, there were more FSE GPs per 100 000 people available in major cities and inner regional areas than in outer regional, remote and very remote areas in most jurisdictions (figure 10.7). The bulk-billed proportion of non-referred attendances was higher in very remote areas than in major cities, where the proportion was in turn higher than in all other areas (table 10A.35).

In 2014-15, 35.2 per cent of Australia's FSE GPs were female (table 10A.25). There were 65.2 FSE female GPs per 100 000 females and 121.3 FSE male GPs per 100 000 males in 2014-15 (figure 10.8). Data are presented for a ten year time series in tables 10A.25 and 10A.26.

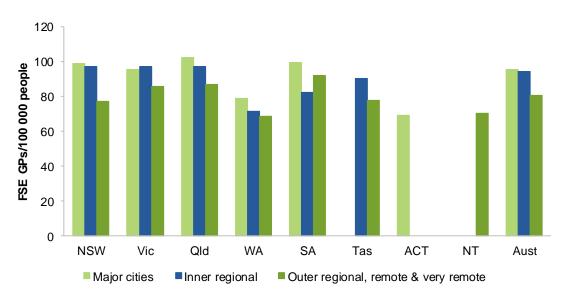

Figure 10.7 Availability of GPs by region, 2014-15a, b

Source: Department of Health (unpublished) MBS Statistics; table 10A.24.

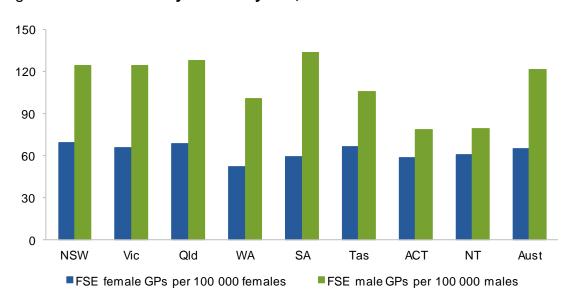

Figure 10.8 Availability of GPs by sex, 2014-15a

^a See box 10.3 and table 10A.24 for detailed definitions, footnotes and caveats. ^b There are no major cities in Tasmania; no outer regional or remote areas in the ACT; no major cities or inner regional areas in the NT. Major cities and inner regional areas are combined for the ACT.

a See box 10.3 and tables 10A.25 and 10A.26 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS Statistics; tables 10A.25 and 10A.26.

Access - Availability of public dentists

'Availability of public dentists' is an indicator of governments' objective to provide equitable access to dental services (box 10.4).

Box 10.4 Availability of public dentists

'Availability of public dentists' is defined as the number of full time equivalent (FTE) public dentists per 100 000 people by region and is based on clinical hours worked in the public sector.

High or increasing availability of public dentists can indicate improved access to public dental services. The availability of public dentists by region may affect people's access to public dental services, particularly in rural and remote areas. Low availability can result in increased travel distance to a dentist and increased waiting times to see a dentist.

This indicator does not provide information on whether people are accessing the service or whether the services are appropriate for the needs of the people receiving them.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions but a break in series means that data for 2014 are not comparable to data for 2013 and previous years
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2014, the number of FTE public dentists per 100 000 people was highest in remote/very remote areas (7.9), followed by outer regional (7.4) and major cities (6.6), and lowest in inner regional areas (6.1) (figure 10.9, table 10A.27). Nationally there were 3.5 FTE public dental therapists per 100 000 people in 2014 (table 10A.28). Data for FTE dental hygienists and dental therapists are presented in table 10A.28.

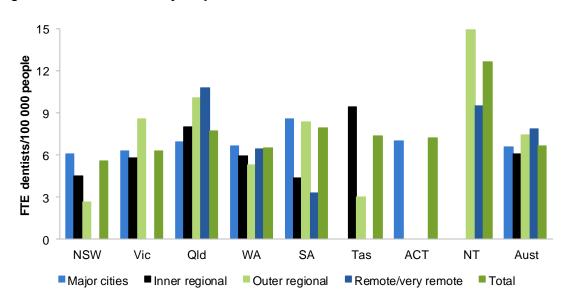

Figure 10.9 Availability of public dentists, 2014a, b, c

Source: AIHW (unpublished) National Health Workforce Data Set; table 10A.27.

Access - Early detection and early treatment for Aboriginal and Torres Strait Islander Australians

'Early detection and early treatment for Aboriginal and Torres Strait Islander Australians' is an indicator of governments' objective to provide equitable access to primary and community healthcare services for Aboriginal and Torres Strait Islander Australians (box 10.5). The availability and uptake of early detection and early treatment services is understood to be a significant determinant of people's health.

a See box 10.4 and table 10A.27 for detailed definitions, footnotes and caveats. b There were no public dentists in remote or very remote areas in Victoria. ^c Tasmania has no major cities. The ACT has no outer regional, remote or very remote areas. The NT has no major cities or inner regional areas.

Box 10.5 Early detection and early treatment for Aboriginal and Torres Strait Islander Australians

'Early detection and early treatment for Aboriginal and Torres Strait Islander Australians' is defined as:

- the identification of individuals who are at high risk for, or in the early stages of, preventable and/or treatable health conditions (early detection)
- the provision of appropriate and timely prevention and intervention measures (early treatment).

Three measures of early detection and early treatment for Aboriginal and Torres Strait Islander Australians are reported:

- the proportion of older people who received a health assessment under DHS Medicare by Indigenous status
 - older people are defined as Aboriginal and Torres Strait Islander Australians aged 55 years or over and other Australians aged 75 years or over, excluding hospital inpatients and people living in aged care facilities
 - health assessments are MBS items that allow comprehensive examinations of patient health, including physical, psychological and social functioning.
- the proportion of older Aboriginal and Torres Strait Islander Australians who received a health assessment under DHS Medicare in successive years of a five-year period
- the proportion of Aboriginal and Torres Strait Islander Australians who received a health assessment or check under DHS Medicare by age group health assessment/checks are available for Aboriginal and Torres Strait Islander children (0–14 years), adults (15–54 years) and older people (55 years or over).

A low or decreasing gap between the proportion of Aboriginal and Torres Strait Islander and other Australians who received a health assessment can indicate more equitable access to early detection and early treatment services for Aboriginal and Torres Strait Islander Australians. An increase over time in the proportion of older Aboriginal and Torres Strait Islander Australians who received a health assessment is desirable as it indicates improved access to these services. A low or decreasing gap between the proportion of Aboriginal and Torres Strait Islander Australians in different age groups who received a health assessment/check can indicate more equitable access to early detection and treatment services within the Aboriginal and Torres Strait Islander population.

This indicator provides no information about health assessments provided outside DHS Medicare. Such services are provided under service delivery models used predominantly by Aboriginal and Torres Strait Islander people, for example, in remote and very remote areas. Accordingly, this indicator understates the proportion of Aboriginal and Torres Strait Islander people who received early detection and early treatment services.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.
- Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2014-15, the proportion of older people receiving a health assessment was 32.7 per cent for Aboriginal and Torres Strait Islander people and 31.4 per cent for other Australians (figure 10.10). There was considerable variation across States and Territories in the relative proportion of older people receiving a health assessment for these populations.

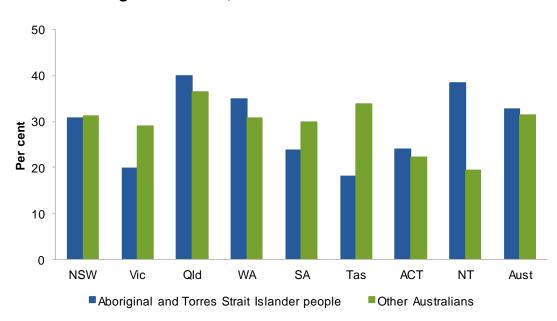

Figure 10.10 Older people who received an annual health assessment by Indigenous status, 2014-15^a

Source: Derived from Department of Health (unpublished) MBS Statistics, ABS (2014) Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026, Cat. no. 3238.0; ABS (various years) Australian demographic statistics, Cat. no. 3101.0; table 10A.30.

Over the five years to 2014-15, the proportion of older Aboriginal and Torres Strait Islander people who received an annual health assessment increased more steeply than for all Australians in all jurisdictions, albeit from a lower base (18.1 per cent at the national level for Aboriginal and Torres Strait Islander people and 26.8 per cent for all Australians) (table 10A.30). Data are presented for an eight year time series for Aboriginal and Torres Strait Islander people in table 10A.31 and for a nine year time series for all Australians in table 10A.33.

The proportion of the eligible Aboriginal and Torres Strait Islander population who received a health assessment or check in 2014-15 was highest for older people in all jurisdictions, and lowest for children aged 0–14 years in most jurisdictions (table 10A.32).

^a See box 10.5 and table 10A.30 for detailed definitions, footnotes and caveats.

Access – Developmental health checks

'Developmental health checks' is an indicator of governments' objective to provide equitable access to early detection and intervention services for children (box 10.6).

Box 10.6 **Developmental health checks**

'Developmental health checks' is defined as the proportion of children who received a fourth year developmental health assessment under DHS Medicare, by health assessment type.

A high or increasing proportion of children receiving a fourth year developmental health assessment is desirable as it suggests improved access to these services.

The 'Healthy Kids Check' MBS health assessment item is available to all children aged 3 or 4 years, while the 'Aboriginal and Torres Strait Islander Peoples Health Assessment' item is available to Aboriginal and Torres Strait Islander people of all ages. The proportion of Aboriginal and Torres Strait Islander children aged 3 to 5 years who received the Aboriginal and Torres Strait Islander Peoples Health Assessment is reported as a proxy for the proportion of Aboriginal and Torres Strait Islander children who received a fourth year developmental health assessment. The proportion of other children who received either a Healthy Kids Check (at the age of 3 or 4 years), or a Health assessment at the age of 5 years, is reported as a proxy for the proportion of other children who received a fourth year developmental health assessment. Children are counted once only.

Fourth year developmental health assessments are intended to assess children's physical health, general wellbeing and development. Early identification provides the opportunity for timely prevention and intervention measures that can ensure children are healthy, fit and ready to learn when they start schooling.

This indicator provides no information about developmental health checks for children that are provided outside DHS Medicare, as comparable data for such services are not available for all jurisdictions. Accordingly, this indicator understates the proportion of children who receive a fourth year developmental health check.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions but a break in series means that data from 2012-13 onwards are not comparable to data for previous years
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally, the proportion of children who received a fourth year developmental health check under DHS Medicare was 58.9 per cent in 2014-15 (table 10A.34). The proportion was higher for Aboriginal and Torres Strait Islander children (80.9 per cent) than for other children (57.6 per cent), although there was considerable variation across jurisdictions (figure 10.11).

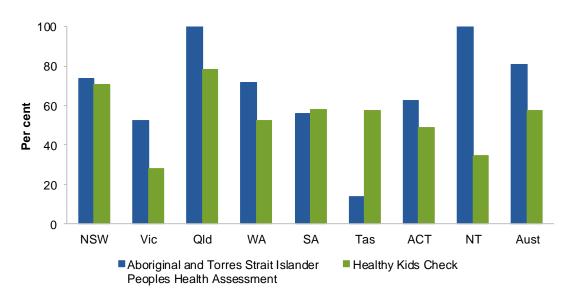

Figure 10.11 Children who received a fourth year developmental health check, by health check type, 2014-15a

Source: Department of Health (unpublished) MBS Statistics; ABS (2014) Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026, Cat. no. 3238.0; ABS (unpublished) Australian demographic statistics, Cat. no. 3101.0; table 10A.34.

Effectiveness

Access - Effectiveness of access to GPs

'Effectiveness of access to GPs' is an indicator of governments' objective to provide effective access to primary healthcare services (box 10.7). The effectiveness of services can vary according to the affordability and timeliness of services that people can access.

Box 10.7 Effectiveness of access to GPs

'Effectiveness of access to GPs' is defined by four measures:

- bulk billing rates, defined as the proportion of non-referred attendances by GPs and practice nurses that were bulk billed
- people deferring visits to GPs due to financial barriers, defined as the proportion of people who delayed seeing or did not see a GP at any time in the previous 12 months due to cost

(continued next page)

a See box 10.6 and table 10A.34 for detailed definitions, footnotes and caveats.

Box 10.7 (continued)

- GP waiting times, defined as the proportion of people who, in the previous 12 months, saw a GP for urgent medical care within specified times from making the appointment. Specified waiting time categories are: less than 4 hours; 4 to less than 24 hours; 24 hours or more
- potentially avoidable presentations to emergency departments (interim measure), defined as the number of selected 'GP-type presentations' to emergency departments, where selected GP-type presentations are emergency presentations:
 - allocated to triage category 4 (semi-urgent) or 5 (non-urgent)
 - not arriving by ambulance, with police or corrections
 - not admitted or referred to another hospital
 - who did not die.

A high or increasing bulk billing rate can indicate more affordable access to GP services. This measure does not provide information on whether the services are appropriate for the needs of the people receiving them.

A low or decreasing proportion of people deferring visits to GPs due to financial barriers indicates more widely affordable access to GPs. Data for this measure include 95 per cent confidence intervals (in the form of error bars in figures and percentages in tables).

A high or increasing proportion of people who saw a GP within 4 hours for urgent medical care indicates more timely access to GPs.

Data reported for these three measures are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

The Patient Experience Survey (PExS) does not include people living in discrete Aboriginal and Torres Strait Islander communities, which affects the comparability of the NT results for the measures people deferring visits to GPs due to financial barriers and GP waiting times.

Potentially avoidable presentations to emergency departments are presentations for conditions that could be appropriately managed in the primary and community health sector. In some cases, this can be determined only retrospectively and presentation to an emergency department is appropriate. A low or decreasing proportion of potentially avoidable presentations to emergency departments can indicate better access to primary and community health care.

Data reported for this measure are:

- comparable (subject to caveats) within some jurisdictions over time but not comparable within other jurisdictions over time or across jurisdictions (see caveats in attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Effectiveness of access to GPs — bulk billing rates

Where bulk billing is used, patients incur no out-of-pocket expense and, for most GP services, the GP receives the full Schedule fee from DHS Medicare. Nationally in 2014-15, the bulk billed proportion of non-referred attendances was 84.6 per cent. For States and Territories, this proportion generally increased in the period 2010-11 to 2014-15 (figure 10.12). The GP bulk billing rate was highest in very remote areas and lowest in inner regional, outer regional and remote areas in 2014-15 (table 10A.35). Non-referred attendances for children under 16 years and older people were bulk billed at higher rates than people aged 16 to 64 years in 2014-15 (table 10A.36).

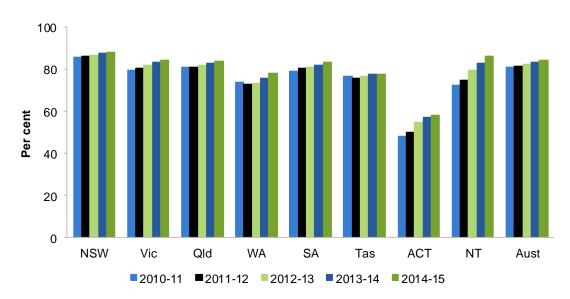

Figure 10.12 **GP visits that were bulk billed**^a

Effectiveness of access to GPs — people deferring visits to GPs due to financial barriers

Nationally in 2014-15, 5.0 per cent of the population reported that they delayed or did not visit a GP in the previous 12 months because of cost (figure 10.13).

Data for Aboriginal and Torres Strait Islander Australians deferring access to GPs due to cost are presented in table 10A.38. These data are sourced from a different data collection to the data for the general population and are not directly comparable.

^a See box 10.7 and table 10A.36 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS Statistics; table 10A.36.

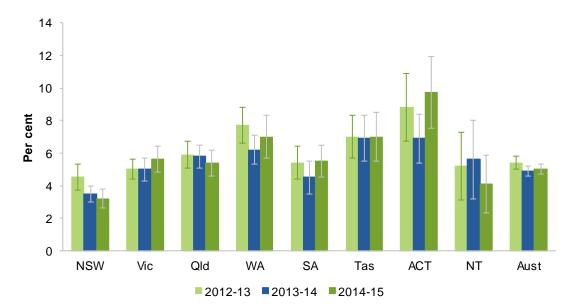

Figure 10.13 People deferring visits to GPs due to cost^a

Effectiveness of access to GPs — GP waiting times

Nationally in 2014-15, for people who saw a GP for urgent care:

- 63.9 per cent waited less than 4 hours
- 11.1 per cent waited from 4 to less than 24 hours
- 25.0 per cent waited for 24 hours or more (table 10A.39).

Overall, 20.8 per cent of people who saw a GP for any reason waited longer than they felt was acceptable to get an appointment (table 10A.40).

Effectiveness of access to GPs — GP-type presentations to emergency departments

Factors contributing to GP-type presentations at emergency departments include perceived or actual lack of access to GP services, the proximity of emergency departments and trust in emergency department staff. Nationally, there were around 2.8 million GP-type presentations to public hospital emergency departments in 2014-15 (table 10.3). Supplementary survey data for people who visited an emergency department for healthcare they thought could have been provided at a general practice are presented for 2010-11 to 2012-13 in table 10A.42.

a See box 10.7 and table 10A.37 for detailed definitions, footnotes and caveats.
 Source: ABS (unpublished) Patient Experience Survey (various years), Cat. no. 4839.0; table 10A.37.

Table 10.3 GP-type presentations to emergency departments, ('000)a

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|---------|---------|-------|-------|-------|-------|------|------|------|---------|
| 2013-14 | 1 047.2 | 625.8 | 450.2 | 314.2 | 172.4 | 61.6 | 53.3 | 57.5 | 2 782.3 |
| 2014-15 | 1 060.2 | 615.9 | 435.9 | 331.8 | 166.0 | 61.1 | 55.8 | 54.8 | 2 781.4 |

^a See box 10.7 and table 10A.41 for detailed definitions, footnotes and caveats.

Access - Financial barriers to PBS medicines

'Financial barriers to PBS medicines' is an indicator of governments' objective to ensure effective access to prescribed medicines (box 10.8).

Box 10.8 Financial barriers to PBS medicines

'Financial barriers to PBS medicines' is defined as the proportion of people who delayed getting or did not get a prescription filled at any time in the previous 12 months due to cost.

A low or decreasing proportion of people deferring treatment due to financial barriers indicates more widely affordable access to medications.

Data for this indicator include 95 per cent confidence intervals (in the form of error bars in figures and percentages in tables).

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

The PExS does not include people living in discrete Aboriginal and Torres Strait Islander communities, which affects the comparability of the NT results.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2014-15, 7.6 per cent of respondents delayed or did not purchase prescribed medicines due to cost in the previous 12 month period (figure 10.14).

Data for Aboriginal and Torres Strait Islander Australians are presented in table 10A.44. These data are sourced from a different data collection to the data for the general population and are not directly comparable.

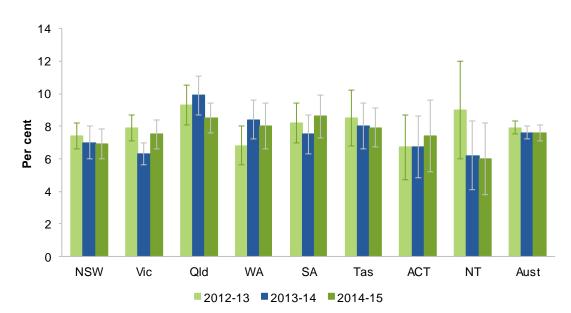

Figure 10.14 People deferring purchase of prescribed medicines due to cost^a

Access - Public dentistry waiting times

'Public dentistry waiting times' is an indicator of governments' objective to ensure timely access to public dental services for eligible people (box 10.9).

Box 10.9 **Public dentistry waiting times**

'Public dentistry waiting times' is defined as the median time waited between being placed on a public dentistry waiting list and receiving dental care (or, if data not available, being offered dental care).

A shorter median time waited to see a dental professional indicates more timely access to public dental services.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- incomplete for the current reporting period. All required 2014-15 data were not available for NSW and the NT.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Data for the median time waited by people on a public dental waiting list are presented for States and Territories in tables 10A.45–10A.52. Due to a change in data source,

^a See box 10.8 and table 10A.43 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Patient Experience Survey (various years), Cat. no. 4839.0; table 10A.43.

administrative data reported here are not comparable with survey data published in previous reports.

Appropriateness - GPs with vocational registration

'GPs with vocational registration' is an indicator of governments' objective to ensure the GP workforce has the capability to deliver high quality services (box 10.10).

Box 10.10 **GPs with vocational registration**

'GPs with vocational registration' is defined as the proportion of FSE GPs with vocational registration. Vocationally registered GPs are considered to have the values, skills and knowledge necessary for competent unsupervised general practice within Australia (RACGP 2014b).

A high or increasing proportion of FSE GPs with vocational registration can indicate an improvement in the capability of the GP workforce to deliver high quality services. GPs without vocational registration may deliver services of equally high quality, however, their access to DHS Medicare rebates for the general practice services they provide is limited compared to vocationally registered GPs.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Nationally, the proportion of FSE GPs with vocational registration decreased from 85.7 to 81.2 per cent in the period 2010-11 to 2014-15 (figure 10.15). The proportion of FSE GPs with vocational registration was highest in major cities and lowest in outer regional and remote areas in 2014-15 (table 10A.53).

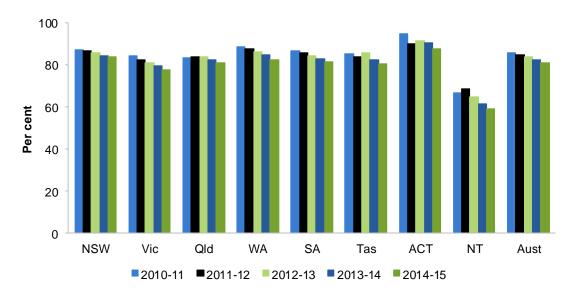

Figure 10.15 FSE GPs with vocational registration^a

Appropriateness - General practices with accreditation

'General practices with accreditation' is an indicator of governments' objective to ensure the GP workforce has the capability to provide high quality services (box 10.11).

Box 10.11 General practices with accreditation

'General practices with accreditation' is defined as the proportion of general practices in Australia that are accredited. Accreditation is a voluntary process of independent third-party peer review that assesses general practices against a set of standards developed by the RACGP.

A high or increasing proportion of practices with accreditation can indicate an improvement in the capability of general practice to deliver high quality services. However, general practices without accreditation may deliver services of equally high quality. For a particular general practice, the decision to seek accreditation might be influenced by perceived costs and benefits unrelated to its quality standards. Accreditation affects eligibility for some government programs (such as PIP), so there are financial incentives for gaining accreditation.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- not available for the current reporting period as data for the number of general practices are not available.

Data quality information for this indicator is under development.

^a See box 10.10 and table 10A.54 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS Statistics; table 10A.54.

The two providers of general practice accreditation services in Australia are Australian General Practice Accreditation Limited (AGPAL) and Quality Practice Accreditation Pty Ltd. Data for the number of accredited practices and the available historical data for the proportion of practices with accreditation are reported in table 10A.55.

The proportion of patients attending accredited practices provides useful additional information relating to accreditation. For this measure, PIP practices provide a proxy for accredited practices, as accreditation is a requirement for PIP registration. Nationally, the proportion of general practice patient care — measured as standardised whole patient equivalents (SWPEs) — provided by PIP practices has increased slightly in all jurisdictions in the period 2009-10 to 2013-14 (table 10A.56).

Appropriateness – Management of acute upper respiratory tract infection

'Management of acute upper respiratory tract infection' is an indicator of governments' objective to ensure that antibiotics are used appropriately and effectively (box 10.12).

Box 10.12 Management of upper respiratory tract infection

'Management of acute upper respiratory tract infection' (URTI) is defined by two measures:

- proportion of visits to GPs for acute URTI where systemic antibiotics are prescribed
- filled GP prescriptions for selected antibiotics (those oral antibiotics most commonly prescribed to treat URTI) per 1000 people.

Low or decreasing rates of acute URTI GP visits where systemic antibiotics are prescribed, and of filled GP prescriptions for the selected antibiotics, can indicate that GPs' management of acute URTI more closely follows guidelines. URTI without complication (acute URTI or the 'common cold') is most often caused by a virus. Antibiotics have no efficacy in the treatment of viral infections, but are nevertheless often prescribed for their treatment. Unnecessarily high rates of antibiotic prescription have the potential to increase both pharmaceutical costs and antibiotic resistance in the community (Tamma and Cosgrove 2014).

Data for the measure proportion of visits to GPs for acute URTI where systemic antibiotics are prescribed include 95 per cent confidence intervals (in the form of error bars in figures and percentages in tables).

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time but a break in time series
 means that data from 2012-13 onwards are not comparable to data for previous years for
 the measure filled GP prescriptions for selected antibiotics
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for the measure filled GP prescriptions for selected antibiotics is at www.pc.gov.au/rogs/2016. Data quality information for the measure acute URTI GP visits where systemic antibiotics are prescribed is under development.

The annual BEACH (Bettering the Evaluation and Care of Health) survey comprises around 1000 GPs, each providing data for around 100 patient visits. Aggregation of data for a period of 5 years allows publication of data for all states and territories. This has some limitations — short-term change will be reflected only if substantive when averaged over a five-year period, and proximate causes of change will not be directly identifiable. These limitations are to a degree mitigated by the reporting of data for each year in the reference period at the national level. This will assist in interpreting whether change reflected over rolling five-year periods is due to substantive short-term change or to incremental change over several years.

Nationally, the proportion of people presenting to GPs for acute URTI who were prescribed systemic antibiotics for its treatment decreased from 32.4 per cent over the five-year period April 2006–March 2011, to 30.2 per cent over the five-year period April 2010–March 2015. Results varied across jurisdictions (figure 10.16).

Single year data at the national level are available in table 10A.60.

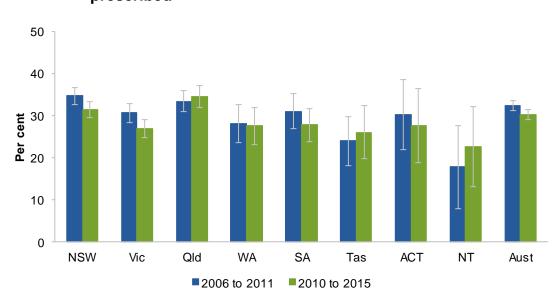

Figure 10.16 Acute URTI managements where systemic antibiotics were prescribed^a

Caution should be used in interpreting the rate of prescription of the selected antibiotics as the oral antibiotics most commonly prescribed to treat acute URTI are also prescribed for other illnesses. Information about the condition for which the antibiotics are prescribed is not available through the PBS.

^a See box 10.12 and table 10A.59 for detailed definitions, footnotes and caveats. Source: Britt et al. (unpublished) BEACH Statistics; table 10A.59.

Nationally, the prescription rate for the oral antibiotics most commonly used to treat acute URTI rose slightly from 302 in 2012-13 to 305 per 1000 people in 2014-15 (table 10A.57).

Appropriateness – Chronic disease management

'Chronic disease management' is an indicator of governments' objective to ensure appropriate and effective management of chronic disease in the primary and community health sector (box 10.13). Appropriate and effective management in the primary and community health sector can delay the progression of chronic disease and prevent, or minimise the severity of, its complications. In addition to significant improvements in the health and wellbeing of people with chronic disease, the consequent reduced demand for acute services can generate important cost savings. Effective management requires timely, high quality healthcare that meets individual needs and provides continuity of care (Australian Government 2010).

Box 10.13 Chronic disease management

'Chronic disease management' is defined by four measures:

- management of diabetes PIP diabetes incentive, defined as the proportion of general practices enrolled in the PIP that are registered for the PIP diabetes incentive
- management of diabetes HbA1c, defined as the proportion of people with diabetes with HbA1c (glycosolated haemoglobin) below 7 per cent (the number of people with diabetes with HbA1c below 7 per cent, divided by the estimated number of people with diabetes)
- management of asthma, defined as the proportion of people with asthma who have a written asthma action plan
- care planning/case conferencing, defined as the proportion of GPs who used the MBS chronic disease management items for care planning or case conferencing at least once during a 12 month period.

A high or increasing proportion of PIP practices registered for the PIP diabetes incentive, people with diabetes with HbA1c below 7 per cent, people with asthma who have a written asthma action plan, and GPs who use chronic disease management items, is desirable.

Registration for the PIP diabetes incentive requires the implementation of management strategies for patients with diabetes that are based on RACGP clinical guidelines for appropriate type 2 diabetes management in general practice.

HbA1c measures the level of glucose in the blood averaged over the preceding three months, and levels below 7 per cent are indicative of appropriate management of diabetes in that period.

Written asthma action plans enable people with asthma to recognise and respond quickly and appropriately to deteriorating asthma symptoms, thereby preventing or reducing the severity of acute asthma episodes (ACAM 2008).

(continued next page)

Box 10.13 (continued)

Data for the measures management of diabetes — HbA1c and management of asthma include 95 per cent confidence intervals (in the form of error bars in figures and percentages in tables).

Chronic disease management items in the MBS allow for the preparation and regular review of care plans for individuals with complex, multidisciplinary care needs due to chronic or terminal medical conditions, through GP managed or multidisciplinary team based care. Individual compliance with management measures is also a critical determinant of the occurrence and severity of complications for patients with chronic disease.

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required data are available
 for all jurisdictions for: management of diabetes PIP diabetes incentive (2015);
 management of diabetes HbA1c (2011-12); management of asthma (2011-12); and, care
 planning/case conferencing (2014-15).

The total and non-Indigenous components of the Australian Health Survey 2011–2013 did not include people living in discrete Aboriginal and Torres Strait Islander communities or very remote areas, which affects the comparability of the NT results for the measures management of diabetes — HbA1c and management of asthma.

Data quality information is at www.pc.gov.au/rogs/2016 for the measures management of diabetes — HbA1c and management of asthma. DQI is under development for the measures management of diabetes — PIP diabetes incentive and care planning/case conferencing.

Chronic diseases are generally long term and often progressive conditions. Chronic disease is estimated to be responsible for more than 80 per cent of the burden of disease and injury suffered by Australians (Australian Government 2010).

Chronic disease management — diabetes

People with diabetes are at high risk of serious complications such as cardiovascular, eye and kidney disease. Type 2 diabetes is the most common form of diabetes and is largely preventable. The PIP diabetes incentive provides incentives to eligible practices to improve management of patients with diabetes. In order to register for the PIP Diabetes incentive, general practices are required to maintain an active patient register and recall and reminder system for all known patients with diabetes mellitus, and to agree to implement an annual cycle of care for patients with diabetes mellitus. The annual cycle of care is generally based on the RACGP's clinical guidelines for the management of Type 2 diabetes in general practice, which represent the minimum required level of care.

Nationally, the proportion of PIP practices registered for the PIP diabetes incentive increased from 47.3 per cent in May 2014 to 51.5 per cent in May 2015, with similar increases in all States and Territories (figure 10.17).

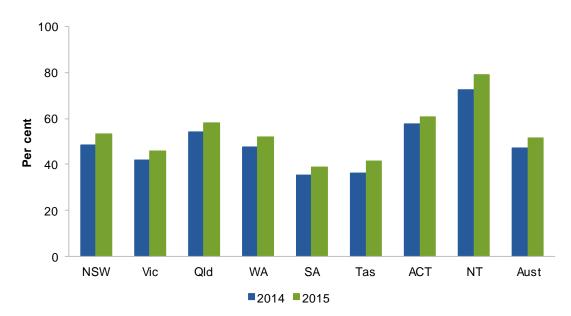

Figure 10.17 PIP practices registered for the PIP diabetes incentive^a

HbA1c provides a measure of the average blood glucose level for the preceding three months. Diabetes management guidelines indicate that HbA1c levels should be tested at least every 6 months and that a HbA1c level at or below 7 per cent indicates appropriate management. Nationally, 77.5 per cent of people with known diabetes in 2011-12 had a HbA1c test in the previous 12 months (table 10A.62).

Nationally, 50.5 per cent of people with known diabetes in 2011-12 had a HbA1c level at or below 7 per cent (figure 10.18).

a See box 10.13 and table 10A.61 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS and PIP data collections; table 10A.61.

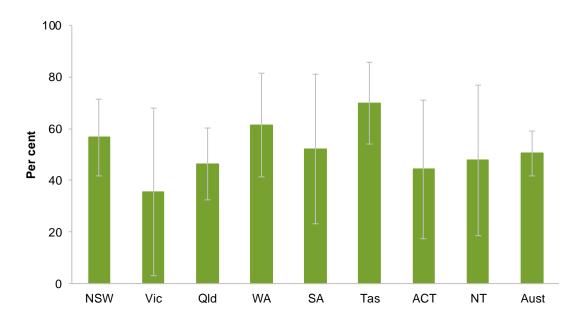

Figure 10.18 People with known diabetes with HbA1c level 7 per cent or less, 2011-12^a

Chronic disease management — asthma

Asthma is a common chronic disease among Australians — particularly children — and is associated with wheezing and shortness of breath. Asthma can be intermittent or persistent, and varies in severity.

Nationally, the age standardised proportion of people with asthma reporting that they have a written asthma action plan was 24.6 per cent for people of all ages in 2011-12, compared to 22.9 per cent in 2004-05 (figure 10.19). The proportion of people with asthma reporting that they have a written asthma action plan was higher for children aged 0–14 years than for other age groups in all jurisdictions (table 10A.64).

Nationally, the proportion of Aboriginal and Torres Strait Islander people with asthma reporting that they have a written asthma action plan was 29.4 per cent for people of all ages and 50.9 per cent for children aged 0–14 years in 2012-13 (table 10A.65). Data for people of all ages are reported by Indigenous status for 2004-05 and 2011–13 in table 10A.66. Data for people of all ages are reported by geographical region for 2007-08 in table 10A.67.

^a See box 10.13 and table 10A.63 for detailed definitions, footnotes and caveats.
Source: ABS (unpublished) Australian Health Survey, 2011–13 (2011-12 National Health Measures Survey component), Cat. No. 4364.0; table 10A.63.

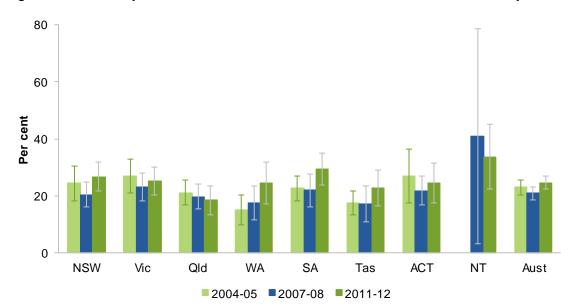

Figure 10.19 People with asthma who have a written asthma action plan^a

a See box 10.13 and table 10A.64 for detailed definitions, footnotes and caveats.
Source: ABS (unpublished) Australian Health Survey, 2011–2013 (2011-12 NHS component), Cat. No. 4364.0; ABS (unpublished) National Health Survey, 2007-08, 2004-05, Cat. No. 4364.0; table 10A.64.

Chronic disease management — care planning and case conferencing

Nationally, the proportion of GPs who used chronic disease management MBS items for care planning or case conferencing remained steady over the five years to 2014-15 (97.3 per cent in 2014-15) (table 10A.68).

Mini-case study — a state-wide chronic disease management program in Queensland

Queensland Health conducted a centralised, state-wide implementation of an evidence-based program to improve chronic disease management. The program and results of an independent evaluation are outlined in box 10.14.

Box 10.14 Mini-case study: Queensland Health's implementation of the COACH Program for chronic disease management

Queensland Health's centralised, state-wide implementation of the evidence-based chronic disease management program (COACH) has proven successful in improving chronic disease management for eligible clients throughout Queensland – including those in rural and remote locations and Aboriginal and Torres Strait Islander people.

The COACH Program

The COACH (Coaching Patients on Achieving Cardiovascular Health) Program is a structured coaching program for people with or at high risk of developing chronic disease(s), delivered by telephone and mail-out over a period of 6 months. Clients are coached to effectively manage chronic disease risk factors, thereby preventing or delaying development and progression of the disease(s).

Health professionals trained as coaches deliver structured program content by phone with the support of a customised, web-based software application (which also supports program evaluation). Coaches work with clients to develop an understanding of biomedical and lifestyle risk factors for their chronic disease(s) and an action plan to modify them in line with national management guideline recommendations. Clients are supported to actively engage with their usual health provider in monitoring risk factor levels and adhering to appropriate medication regimens. Coaching sessions are followed by mail-out of a structured report summarising the session, the agreed goals for the next session and a chart of progress against guideline-recommended risk factor levels.

Further information about the COACH Program can be found at www.thecoachprogram.com.

Queensland Health's implementation of the COACH Program

Queensland Health's centralised COACH Program was implemented in 2009 using the existing telephone infrastructure of 13HEALTH, a 24-hour, seven-day-a-week state-wide service providing health information, triage and referral. Initially available to clients with cardiovascular disease, it has since been extended to cover diabetes, pre-diabetes and chronic obstructive pulmonary diesase (COPD). Referrals are either online or by fax, email, phone or mail, and are made by hospitals, GPs, specialists and Quitline, or self-referral. Program staff initiate contact with clients following referral.

Modelling of program delivery costs in 2014 determined overall recurrent expenditure to be around \$1200 per completing participant.

An independent evaluation of risk factor management was conducted for 2669 people completing Queensland Health's COACH Program (83 per cent completion rate) between 2009 and 2013, using prospectively collected program data (Ski et al. 2015). Participants were the cohorts enrolled in the program with a primary diagnosis of coronary heart disease (CHD) (1962 people) or type 2 diabetes (707 people). Demographics were reflective of the general Queensland population, including Indigenous status and remoteness of residence. Statistically significant improvements were demonstrated across all biomedical and lifestyle cardiovascular risk factors. Improvements for Aboriginal and Torres Strait Islander people were similar to those for non-Indigenous clients.

(continued next page)

Box 10.14 (continued)

The most clinically significant risk factor improvements were:

- decreased mean low-density lipoprotein cholesterol (2.4 to 1.8 mmol/L (CHD); 2.5 to 2.0 mmol/L (type 2 diabetes))
- decreased mean HbA1c levels (7.8 to 7.4 per cent (CHD); 8.2 to 7.5 per cent (type 2 diabetes))
- decreased mean alcohol intake (standard drinks per day) (1.4 to 1.1 (CHD); 1.3 to 0.9 (type 2 diabetes))
- increased mean physical activity (minutes per week) (142 to 229 (CHD); 127 to 182 (type 2 diabetes)).

Source: Queensland Government (unpublished); Ski et al. (2015); Vale et al. (2004).

Appropriateness - Use of pathology tests and diagnostic imaging

'Use of pathology tests and diagnostic imaging' is an indicator of governments' objective to ensure that primary healthcare services are appropriate (box 10.15).

Box 10.15 Use of pathology tests and diagnostic imaging

'Use of pathology tests and diagnostic imaging' is defined by four measures:

- MBS items rebated through DHS Medicare for pathology tests requested by vocationally registered GPs and OMPs, per person
- diagnostic imaging services provided on referral from vocationally registered GPs and OMPs and rebated through DHS Medicare, per person
- DHS Medicare benefits paid per person for pathology tests
- DHS Medicare benefits paid per person for diagnostic imaging.

This indicator needs to be interpreted with care as appropriate levels of use of pathology tests and diagnostic imaging cannot be determined. A high or increasing level of use can reflect overeliance on tools to support the diagnostic process. A low or decreasing level of use can contribute to misdiagnosis of disease and to relatively poor treatment decisions. Pathology tests and diagnostic imaging are important tools used by GPs in the diagnosis of many diseases, and in monitoring response to treatment. Pathology and diagnostic imaging services performed at the request of vocationally registered GPs and OMPs and rebated through DHS Medicare is used as a proxy in reporting against this indicator.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time but a break in time series means that data from 2012-13 onwards are not comparable to data for previous years
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

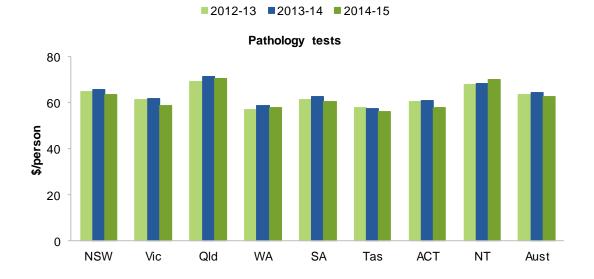

Available data do not exactly reflect the services requested and performed. For example, rebates are provided for a maximum of three MBS pathology items — additional pathology tests can be requested and performed, but are excluded from the data because rebates are not provided. A radiologist can identify the need for and perform more or different diagnostic imaging services than requested. DHS Medicare data reflect only those services provided and rebated.

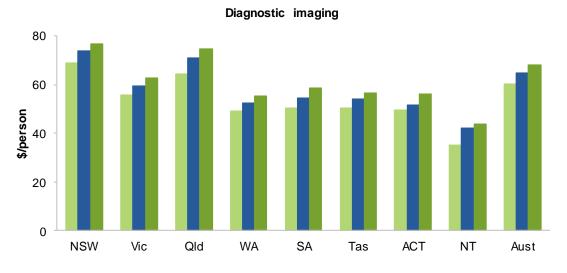

Nationally in 2014-15:

- there were 86 652 rebated MBS items for pathology tests requested by GPs and eligible nurse practitioners, costing \$1.6 billion (table 10A.69). This translated to crude rates of 3.7 MBS items per person at a cost of \$66 per person (crude rates are not presented in table 10A.69)
- there were 14 572 rebated MBS items for diagnostic imaging performed on referral from GPs and eligible nurse practitioners, costing \$1.7 billion (table 10A.71). This translated to crude rates of 0.62 MBS items per person at a cost of around \$72 per person (crude rates are not presented in table 10A.71).

Age-standardised rates are presented for reference years from 2012-13 in figure 10.20 and tables 10A.69 (pathology tests) and 10A.71 (diagnostic imaging). Historical data are presented as crude rates and are provided in tables 10A.70 (pathology tests) and 10A.72 (diagnostic imaging).

Figure 10.20 Benefits paid for GP-referred pathology tests and diagnostic imaging rebated through DHS Medicare (ASR)^a

^a See box 10A.15 and tables 10A.69 and 10A.71 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS and DVA data collections; tables 10A.69 and 10A.71.

Quality — Safety — Electronic health information systems

'Electronic health information systems' is an indicator of governments' objective to improve patient safety through enhanced access to patient health information at the point of care and more efficient coordination of care across multiple providers and services (box 10.16).

Box 10.16 Electronic health information systems

'Electronic health information systems' is defined as the proportion of general practices enrolled in the PIP that are registered for the PIP eHealth incentive.

A high or increasing proportion can indicate that patient health information at the point of care and coordination of care across multiple providers and services are desirable or are improved, minimising the likelihood of patient harm due to information gaps.

The PIP does not include all practices in Australia. PIP practices provided around 83.0 per cent of general practice patient care in Australia in 2010-11 (Department of Health unpublished; table 10A.56).

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2015 data are available for all jurisdictions.

Data quality information for this indicator is under development.

The PIP eHealth Incentive aims to encourage general practices to keep up to date with the latest developments in electronic health information systems. Current eligibility requirements require practices to:

- integrate healthcare identifiers into electronic practice records
- have a secure messaging capability
- use data records and clinical coding of diagnoses
- send prescriptions electronically to a prescription exchange service
- participate in the eHealth record system and be capable of creating and uploading Shared Health Summaries and Event Summaries using compliant software.

Nationally, the proportion of PIP practices using electronic health systems was 89.6 per cent in May 2015, recovering from the sharp decrease — from 88.3 per cent in May 2012 to 72.2 per cent in May 2013 — that was associated with the time taken to implement new eligibility requirements for many practices (figure 10.21). The proportion of PIP practices using electronic health systems increased in all areas between May 2013 and May 2015, remaining lower in remote and very remote areas than in other areas (table 10A.74).

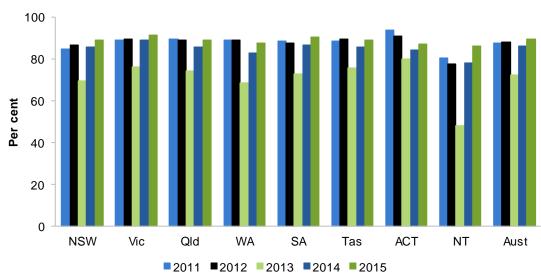

Figure 10.21 PIP practices using electronic health systems^a

Quality — Responsiveness — Patient satisfaction

'Patient satisfaction' is an indicator of governments' objective that primary and community health services are high quality and account for individual patient needs (box 10.17).

 $[{]f a}$ See box 10.16 and table 10A.73 for detailed definitions, footnotes and caveats. Source: Department of Health (unpublished) MBS and PIP data collections; table 10A.73.

Box 10.17 Patient satisfaction

'Patient satisfaction' is defined as the quality of care as perceived by the patient. It is measured as patient experience of 'key aspects of care' — that is, aspects of care that are key factors in patient outcomes and can be readily modified. Two measures of patient experience of communication with health professionals — a key aspect of care — are reported:

- the proportion of people who saw a GP in the previous 12 months where the GP always or often: listened carefully to them; showed respect; and spent enough time with them
- the proportion of people who saw a dental professional in the previous 12 months where the
 dental practitioner always or often: listened carefully to them; showed respect; and spent
 enough time with them.

High or increasing proportions can indicate that more patients experienced communication with health professionals as satisfactory. Data reported against this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

The PExS does not include people living in discrete Aboriginal and Torres Strait Islander communities, which affects the comparability of the NT results.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

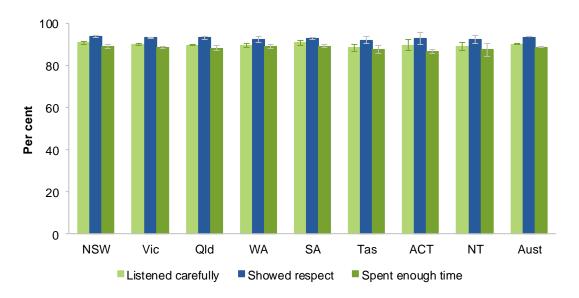

Patient satisfaction — experience with selected key aspects of GP care

Nationally in 2014-15, the majority of respondents reported that the GP always or often:

- listened carefully to them (90.3 per cent)
- showed respect (93.3 per cent)
- spent enough time with them (88.9 per cent) (figure 10.22).

Data are presented by remoteness area in tables 10A.76 and 10A.77. Data for Aboriginal and Torres Strait Islander Australians that are reported in table 10A.78 are not comparable to the data presented here (see DQI for details).

^a See box 10.17 and tables 10A.76-10A.77 for detailed definitions, footnotes and caveats. Source: ABS (unpublished) Patient Experience Survey 2014-15, Cat. no. 4839.0; tables 10A.76-10A.77.

Patient satisfaction — experience with selected key aspects of dental professional care

Nationally in 2014-15, the majority of respondents reported that dentists always or often:

- listened carefully to them (94.5 per cent)
- showed respect (95.7 per cent)
- spent enough time with them (95.7 per cent) (figure 10.23).

Data are presented by remoteness area in tables 10A.79 and 10A.80.

Appropriateness — Quality — continuity

The Steering Committee has identified quality — continuity as an area for development in future Reports. Data for health assessments for older Australians, previously reported as a measure of quality — continuity, are presented for a nine year time series in table 10A.33.

Efficiency

Sustainability

The Steering Committee has identified the sustainability of primary and community health as a key area for development in future reports.

Cost to government of general practice per person

'Cost to government of general practice per person' is an indicator of governments' objective to provide primary healthcare services in an efficient manner (box 10.18).

^a See box 10.17 and tables 10A.79-10A.80 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Patient Experience Survey 2014-15, Cat. no. 4839.0; tables 10A.79-10A.80.

Box 10.18 Cost to government of general practice per person

'Cost to government of general practice per person' is defined as the cost to government of general practice per person in the population.

This indicator needs to be interpreted with care. A low or decreasing cost per person can indicate higher efficiency, provided services are equally or more effective. It can also reflect service substitution between primary healthcare and hospital or specialist services — potentially at greater expense.

Cost to government of general practice does not capture costs of salaried GP service delivery models, used particularly in rural and remote areas, where primary healthcare services are provided by salaried GPs in community health settings, through emergency departments, and Aboriginal and Torres Strait Islander primary healthcare services. Consequently, costs for primary care are understated for jurisdictions where a large proportion of the population live in rural and remote areas.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time but a break in time series means that data from 2012-13 onwards are not comparable to data for previous years
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Australian Government fee-for-service expenditure on general practice and age standardised expenditure per person, through DHS Medicare and the DVA, are reported in table 10A.3 for 2012-13 and subsequent years. Age standardised expenditure per person data are also presented in figure 10.24. Nationally in 2014-15, fee-for-service expenditure on general practice was \$7.7 billion, translating to a crude rate of \$328 per person (crude rates are not presented in table 10A.3). Data incorporating fee-for-service and GP program expenditure are reported as crude rates in table 10A.4 — data in tables 10A.3 and 10A.4 are not comparable.

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5).

Child immunisation coverage

'Child immunisation coverage' is an indicator of governments' objective to achieve high immunisation coverage for children to prevent selected vaccine preventable diseases (box 10.19).

^a See box 10A.18 and table 10A.3 for detailed definitions, footnotes and caveats.
Source: Department of Health (unpublished) MBS Statistics; DVA (unpublished), DVA data collection; table 10A.3.

Box 10.19 Child immunisation coverage

'Child immunisation coverage' is defined by three measures:

- the proportion of children aged 12 months to less than 15 months who are fully immunised (at this age, immunised against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis b, *Haemophilus influenzae* type b and, from the quarter ending 31 December 2013, pneumococcal)
- the proportion of children aged 24 months to less than 27 months who are fully immunised (at this age, against diphtheria, tetanus, whooping cough, polio, *Haemophilus influenzae* type b, hepatitis B, measles, mumps and rubella and, from the quarter ending 31 December 2014, meningococcal C and varicella [chickenpox])
- the proportion of children aged 60 months to less than 63 months who are fully immunised (at this age, against diphtheria, tetanus, whooping cough, polio, and measles, mumps and rubella).

A high or increasing proportion of children who are fully immunised indicates a reduction in the risk of children contracting a range of vaccine preventable diseases.

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Many providers deliver child immunisation services (table 10A.81). High immunisation coverage levels are encouraged through a range of measures, including incentives for providers to report completed vaccinations to the Australian Childhood Immunisation Register (ACIR) and incentives for parents, which link eligibility for Family Tax Benefit Part A Supplement, Child Care Benefit and Child Care Rebate to the child's immunisation status.

For children aged 12 to less than 15 months, proportions of those fully immunised have fluctuated between 90.4 and 91.8 per cent in the eight year period from 2007-08 (table 10A.82). In 2014-15, the proportion was 91.3 per cent (figure 10.25).

For children aged 24 to less than 27 months, the proportion fully immunised decreased from 92.4 per cent or above in the years 2010-11 to 2013-14 to 89.2 per cent in 2014-15, associated with the addition of new vaccines to the definition of fully immunised in the quarter ending 31 December 2014 (figure 10.25; table 10A.83).

For children aged 60 to less than 63 months, the proportion fully immunised in 2014-15 was 92.3 per cent – continuing the annual increase from 80.3 per cent in 2008-09 (figure 10.25; table 10A.84).

100 80 60 20 NSW Vic Qld WA SA Tas ACT NT Aust

■60 to less than 63

Figure 10.25 Children who were fully immunised, by age (months) 2014-15^a

Notifications of selected childhood diseases

12 to less than 15

'Notifications of selected childhood diseases' is an indicator of governments' objective to improve population health outcomes through the prevention of selected vaccine preventable childhood diseases (box 10.20).

a See box 10.19 and tables 10A.82–10A.84 for detailed definitions, footnotes and caveats. *Source*: Department of Health (unpublished) ACIR data collection; tables 10A.82–10A.84.

Box 10.20 Notifications of selected childhood diseases

'Notifications of selected childhood diseases' is defined as the number of notifications of measles, pertussis and invasive Haemophilus influenzae type b reported to the National Notifiable Diseases Surveillance System (NNDSS) by State and Territory health authorities for children aged 0-14 years, per 100 000 children in that age group.

A low or reducing notification rate for the selected diseases indicates that the immunisation program is more effective.

Measles, pertussis (whooping cough) and invasive Haemophilus influenzae type b are nationally notifiable vaccine preventable diseases, and notification to the relevant State or Territory authority is required on diagnosis. The debilitating effects of these diseases can be long-term or even life threatening.

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2014-15, the rate of notifications for children aged 0–14 years was:

- 0.2 per 100 000 for *Haemophilus influenzae* type b (table 10A.87)
- 1.4 per 100 000 for measles (a marked decrease from the nine-year high of 4.0 in 2013-14) (table 10A.85)
- 150.1 per 100 000 for pertussis (whooping cough) (figure 10.26 and table 10A.86).

Historical data for the nine years of reporting are in tables 10A.85–10A.87.

Notification (NSW) Vic Qld WA SA Tas ACT NT Aust

2013-14

2014-15

Participation for women in breast cancer screening

'Participation for women in breast cancer screening' is an indicator of governments' objective to reduce morbidity and mortality attributable to breast cancer through the provision of early detection services (box 10.21).

Early detection of breast cancer is associated with a higher likelihood of survival and with reduced morbidity through availability of less invasive treatment options, such as breast conserving surgery (AIHW and NBCC 2007).

a See box 10.20 and table 10A.86 for detailed definitions, footnotes and caveats.

Box 10.21 Participation for women in breast cancer screening

'Participation for women in breast cancer screening' is defined as the number of women aged 50–69 years who are screened in the BreastScreen Australia Program over a 24 month period, divided by the estimated population of women aged 50–69 years and reported as a rate.

A high or increasing participation rate is desirable.

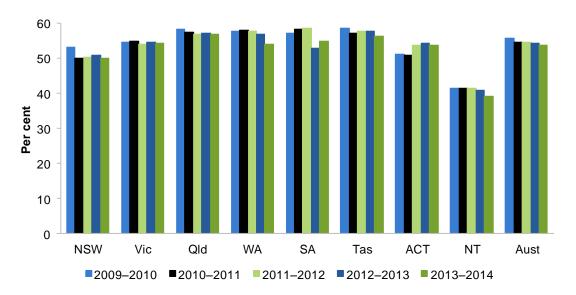

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required data for the 24-month period 2013 and 2014 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The national age standardised participation rate for women aged 50–69 years decreased from 55.8 per cent for the 24 month reference period 2009–2010 to 53.7 per cent for the 24 month period 2013–2014 (figure 10.27).

^a See box 10.21 and table 10A.88 for detailed definitions, footnotes and caveats.
Source: State and Territory governments (unpublished); ABS (various years) Population by Age and Sex, Australian States and Territories, Cat. no. 3201.0; table 10A.88.

Aboriginal and Torres Strait Islander women, women from non-English speaking backgrounds (NESB) and women living in outer regional, remote and very remote areas can experience particular language, cultural and geographic barriers to accessing breast cancer screening. Participation rates for community groups at or close to those for the total population indicate equitable access to early detection services. Data are not directly

comparable within or across community groups as Indigenous and NESB status identification in administrative records varies.

For the 24-month period 2013–2014, the participation rate for women aged 50–69 years was 36.3 per cent for Aboriginal and Torres Strait Islander women and 52.1 per cent for NESB women. For both groups, participation rates were higher in most jurisdictions than in the previous 24-month period 2012–2013 (tables 10A.90 and 10A.91). Updated State and Territory data for participation rate by remoteness area were unavailable for the 2016 Report (some historical data are reported in table 10A.92).

Participation for women in cervical screening

'Participation for women in cervical screening' is an indicator of governments' objective to reduce morbidity and mortality attributable to cervical cancer through the provision of early detection services (box 10.22).

It is estimated that up to 90 per cent of the most common type of cervical cancer (squamous cervical cancer) can be prevented if cell changes are detected and treated early (Department of Health 2012; Mitchell, Hocking and Saville 2003).

Box 10.22 Participation for women in cervical screening

'Participation for women in cervical screening' is defined as the proportion of the estimated eligible population of women aged 20–69 years who are screened over a two-year period, reported as a rate. Eligible women are those who have not had a hysterectomy.

A high or increasing proportion of eligible women aged 20–69 years who have been screened is desirable.

Data reported against this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required data for the 24-month period 2013 and 2014 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

For the 24 month period 2013–2014, the national age-standardised participation rate for women aged 20–69 years in cervical screening was 57.3 per cent, a slight decrease from 57.8 per cent for the 24-month period 2009–2010 (figure 10.28). Data are presented for a nine year time series in table 10A.93.

Nationally in 2012-13, the age standardised proportion of Aboriginal and Torres Strait Islander women aged 20–69 years responding to the National Aboriginal and Torres Strait Islander Health survey who reported having a Pap smear at least every 2 years was 53.4 per cent (table 10A.94).

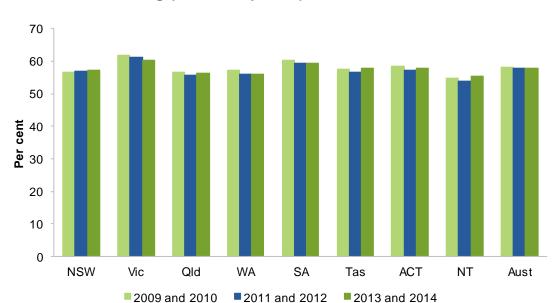

Figure 10.28 Participation rate for women aged 20–69 years in cervical screening (24 month period)^a

Influenza vaccination coverage for older people

'Influenza vaccination coverage for older people' is an indicator of governments' objective to reduce the morbidity/mortality attributable to vaccine preventable disease (box 10.23).

Box 10.23 Influenza vaccination coverage for older people

'Influenza vaccination coverage for older people' is defined as the proportion of people aged 65 years or over who have been vaccinated against seasonal influenza.

A high or increasing proportion of older people vaccinated against influenza reduces the risk of older people contracting influenza and suffering consequent complications.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- not available for the current reporting period.

Data quality information for this indicator is under development.

Influenza and pneumococcal disease vaccinations for older people have been demonstrated to reduce hospitalisations and deaths (Department of Health 2013a). Free vaccines for all Australians aged 65 years or over and for Aboriginal and Torres Strait Islander people aged

^a See box 10.22 and table 10A.93 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) State and Territory Cervical Cytology Registry data collections; table 10A.93.

50 years or over became available for influenza in 1999 and for pneumococcal disease in 2005.

Updated data were not available for non-Indigenous Australians for the 2016 Report — historical data are presented in tables 10A.96-10A.97. Nationally in 2012-13, an estimated 25.3 per cent of Aboriginal and Torres Strait Islander people aged 50 years or over were fully vaccinated against influenza and pneumococcal disease (table 10A.97).

Selected potentially preventable hospitalisations

'Selected potentially preventable hospitalisations' is an indicator of governments' objective to reduce potentially preventable hospitalisations through the delivery of effective primary healthcare services (box 10.24). While not all hospitalisations for the selected conditions can be prevented, there is considerable potential for their reduction through a more effective primary and community health sector.

Box 10.24 Selected potentially preventable hospitalisations

'Selected potentially preventable hospitalisations' is defined as hospital admissions that may be avoided by effective management of illness and injury in the primary and community healthcare sector or, in some cases, by preventing illness and injury altogether. Three measures of selected potentially preventable hospitalisations are reported by jurisdiction of residence:

- potentially preventable hospitalisations for selected vaccine preventable, acute and chronic conditions
- potentially preventable hospitalisations for diabetes
- potentially preventable hospitalisations of older people for falls.

Low or decreasing separation rates for selected potentially preventable hospitalisations can indicate more effective management of selected conditions in the primary and community healthcare sector and/or more effective preventative programs. Factors outside the control of the primary and community healthcare sector also influence hospitalisation rates for these conditions. For example, the underlying prevalence of conditions, patient compliance with management and older people's access to aged care services and other support.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time except for the measure potentially preventable hospitalisations for diabetes
- complete (subject to caveats) for the current reporting period except for the measure potentially preventable hospitalisations for diabetes, for which data are not published for Tasmania, the ACT and the NT. All other required 2013-14 data are available for other jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Potentially preventable hospitalisations for selected vaccine preventable, acute and chronic conditions

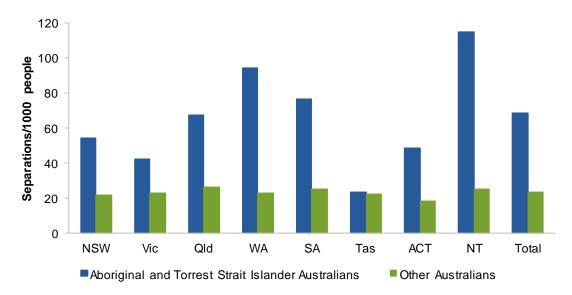

Nationally, the age-standardised hospital separation rate for the selected vaccine preventable, acute and chronic conditions was 24.4 per 1000 people in 2013-14 (table 10.4). Of these, 49.5 per cent were for acute and 47.2 per cent for chronic conditions (table 10A.98). The age-standardised hospital separation rate was higher for Aboriginal and Torres Strait Islander Australians than for other Australians in all jurisdictions for the four years 2010-11 to 2013-14 and, for the three previous years, in all jurisdictions for which Indigenous status data are of sufficient quality for statistical reporting purposes (figure 10.29 and table 10A.99).

Table 10.4 Separations for selected potentially preventable hospitalisations per 1000 people, 2013-14 (ASR)^a

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|--------------------------------|------|------|------|------|------|------|------|------|------|
| Vaccine preventable conditions | 1.1 | 1.3 | 1.2 | 1.2 | 1.5 | 0.7 | 0.9 | 7.6 | 1.3 |
| Selected acute conditions | 10.9 | 10.6 | 14.3 | 12.9 | 13.0 | 10.7 | 9.5 | 21.6 | 12.0 |
| Selected chronic conditions | 10.5 | 11.1 | 12.6 | 10.7 | 11.4 | 10.8 | 8.1 | 21.3 | 11.2 |

Figure 10.29 Separations for selected potentially preventable conditions by Indigenous status (ASR), 2013-14a

a See box 10.24 and table 10A.99 for detailed definitions, footnotes and caveats. Source: AIHW (unpublished) National Hospital Morbidity Database; table 10A.99.

Potentially preventable hospitalisations for diabetes

Diabetes is a chronic disease of increasing prevalence. People with diabetes are at high risk of serious complications such as cardiovascular, eye and kidney disease. Type 2 diabetes is the most common form of diabetes and is largely preventable.

Hospital separations data for diagnoses of diabetes complications are affected by differences in hospitals' clinical coding and admission protocols (between and within jurisdictions), as well as by revisions to clinical coding standards and improvements in data quality over time. Differences in the availability of outpatient services also affect hospital separations data as the data exclude treatment provided in ambulatory care settings (table 10A.107).

Nationally in 2013-14, the age standardised hospital separation rate for Type 2 diabetes mellitus as principal diagnosis was 104.2 separations per 100 000 people (figure 10.30). Of these, 25.6 per cent were same day separations (table 10A.107).

Figure 10.30 Separations for Type 2 diabetes mellitus as principal diagnosis, all hospitals, 2013-14 (ASR)^{a, b}

Source: AIHW (unpublished) National Hospital Morbidity Database; table 10A.106.

The three complications of Type 2 diabetes most commonly leading to hospitalisation in 2013-14 were ophthalmic, renal and circulatory complications. Across almost all jurisdictions for which data are published, the highest age standardised hospital separation rates were for circulatory complications (table 10A.106).

a See box 10.24 and table 10A.106 for detailed footnotes and caveats. b Data for Tasmania, the ACT and the NT are not published separately but are included in the total for Australia.

Serious circulatory complications of diabetes can necessitate lower limb amputation. In 2013-14, there were 16.0 age standardised hospital separations per 100 000 people for lower limb amputations where Type 2 diabetes mellitus was a principal or additional diagnosis (table 10A.108).

Age standardised hospital separation ratios for diabetes (excluding separations for diabetes complications as an additional diagnosis) illustrate differences between the rate of hospital admissions for Aboriginal and Torres Strait Islander Australians and that for all Australians, taking into account differences in the age structures of the two populations. Rate ratios close to one indicate that Aboriginal and Torres Strait Islander Australians have similar separation rates to all people, while higher rate ratios indicate relative disadvantage. A reduction in the gap in hospital separation rates between Aboriginal and Torres Strait Islander Australians and all people can indicate greater equity of access to primary healthcare services. Nationally in 2013-14, the age standardised separation rate for Aboriginal and Torres Strait Islander people was almost four times the rate for all Australians (table 10A.105).

Potentially preventable hospitalisations of older people for falls

Falls were the leading external cause of unintentional injury in older Australians in 2011-12 (Tovell, Harrison & Pointer 2014). For people over 65 years, injurious falls accounted for one in ten days spent in hospital in 2009-10 (Bradley 2013). The age standardised rate of hospital separations for older people with a reported external cause of falls per 1000 older people increased from 50.1 in 2009-10 to 57.8 in 2013-14 (figure 10.31).

Figure 10.31 Separations for older people with a reported external cause of falls (ASR)^{a, b}

Source: AIHW (unpublished) National Hospital Morbidity Database; table 10A.109.

10.4 Future directions in performance reporting

The topic of this chapter is all primary and community health services. However, the indicators remain heavily focused on general practice services. This partly reflects the lack of nationally consistent data available to report potential indicators for other primary and community health services. Priorities for future reporting include:

- further improving the reporting of public dental health services
- reporting of community-based drug and alcohol treatment services
- reporting of additional indicators relating to the use of the MBS chronic disease management items.

Barriers to accessing primary health services contribute to the poorer health status of Aboriginal and Torres Strait Islander Australians compared to other Australians (see the Health sector overview). The Steering Committee has identified primary and community health services for Aboriginal and Torres Strait Islander Australians as a priority area for future reporting and will continue to examine options for the inclusion of further such indicators. The Aboriginal and Torres Strait Islander Health Performance Framework developed under the auspices of the Australian Health Ministers' Advisory Council will inform the selection of future indicators of primary and community health services for Aboriginal and Torres Strait Islander Australians.

^a See box 10.24 and table 10A.109 for detailed definitions, footnotes and caveats. ^b Data for the NT are not available for 2010-11 and are not included in the Australian total.

Definitions of key terms 10.5

Age standardised

Removing the effect of different age distributions (across jurisdictions or over time) when making comparisons, by weighting the age-specific rates for each jurisdiction by the national age distribution.

Annual cycle of care for people with diabetes mellitus within general practice

The annual cycle of care comprises the components of care, delivered over the course of a year, that are minimum requirements for the appropriate management of diabetes in general practice. based on RACGP guidelines.

MBS items can be claimed on completion of the annual cycle of care according to MBS requirements for management, which are based on but not identical to the RACGP guidelines.

Asthma Action Plan

An asthma action plan is an individualised, written asthma action plan incorporating information on how to recognise the onset of an exacerbation of asthma and information on what action to take in response to that exacerbation, developed in consultation with a health professional.

Source: ACAM (Australian Centre for Asthma Monitoring) 2007, Australian asthma indicators: Five-year review of asthma monitoring in Australia. Cat. no. ACM 12, AIHW.

Closed treatment episode

A closed treatment episode is a period of contact between a client and an alcohol and other drug treatment agency. It has defined dates of commencement and cessation, during which the principal drug of concern, treatment delivery setting and main treatment type did not change. Reasons for cessation of a treatment episode include treatment completion, and client non-participation in treatment for 3 months or more. Clients may have more than one closed treatment episode in a data collection period.

Community health services

Health services for individuals and groups delivered in a community setting, rather than via hospitals or private facilities.

Comparability

Data are considered comparable if, (subject to caveats) they can be used to inform an assessment of comparative performance. Typically, data are considered comparable when they are collected in the same way and in accordance with the same definitions. For comparable indicators or measures, significant differences in reported results allow an assessment of differences in performance, rather than being the result of anomalies in the data.

Completeness

Data are considered complete if all required data are available for all jurisdictions that provide the service.

Consultations

The different types of services provided by GPs.

Cost to government of general practice per person

Full time service

Cost to the Australian Government of total non-referred attendances by non-specialist medical practitioners per person.

equivalents (FSE)

FSE (Full Service Equivalent) is an estimated measure of medical workforce based on Medicare claims information. Although Medicare claims data does not include information on hours worked it does have sufficient time-based items to estimate a proxy for hours worked. The FSE methodology models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.

General practice

The organisational structure with one or more GPs and other staff such as practice nurses. A general practice provides and supervises healthcare for a 'population' of patients and may include services for specific populations, such as women's health or Aboriginal and Torres Strait Islander health.

General practitioner (GP)

Vocationally registered GPs — medical practitioners who are vocationally registered under s.3F of the Health Insurance Act 1973 (Cwlth), hold Fellowship of the RACGP or the Australian College of Rural and Remote Medicine (ACRRM) or equivalent, or hold a recognised training placement. From 1996 vocational registration is available only to GPs who attain Fellowship of the RACGP or (from April 2007) the ACRRM, or hold a

recognised training placement.

Other medical practitioners (OMP) — medical practitioners who are not vocationally registered GPs.

GP-type services

Non-referred attendances by vocationally registered GPs and OMPs, and practice nurses.

Haemophilus influenzae type b

A bacterium which causes bloodstream infection, meningitis, epiglottitis, and pneumonia (Department of Health 2013b).

Management of upper respiratory tract infections

Number of prescriptions ordered by GPs for the oral antibiotics most commonly used in the treatment of upper respiratory tract infections per 1000 people with PBS concession cards.

Medicare Locals

A national network of 61 independent regional primary health care organisations with responsibility for supporting improved co-ordination of primary health care service delivery, as well as identifying and addressing gaps in primary health care services, across their regions. Established progressively from July 2011 under the National Health Reform agenda, Medicare Locals (ML) were replaced from 1 July 2015 by PHNs.

Non-referred attendances

GP services, emergency attendances after hours, other prolonged attendances, group therapy and acupuncture. All attendances for specialist services are excluded because these must be 'referred' to receive DHS Medicare reimbursement.

Nationally notifiable disease

A communicable disease that is on the Communicable Diseases Network Australia's endorsed list of diseases to be notified nationally (Department of Health 2013c). On diagnosis of these diseases, there is a requirement to notify the relevant State or Territory health authority.

Other medical practitioner (OMP)

A medical practitioner other than a vocationally registered GP who has at least half of the schedule fee value of his/her DHS Medicare billing from non-referred attendances. These practitioners are able to access only the lower A2 DHS Medicare rebate for general practice services they provide, unless the services are provided through certain Departmental incentive programs.

Pap smear

A procedure for the detection of cancer and pre-cancerous conditions of the female cervix.

PBS doctor's bag

Emergency drug supplies provided without charge to prescribers for use in medical emergencies in the clinic or the community at no charge to the patient.

Per person benefits paid for GP ordered pathology

Total benefits paid under DHS Medicare for pathology tests requested by GPs, divided by the population.

Per person benefits paid for GP referred diagnostic imaging Total benefits paid for diagnostic imaging services performed on referral by GPs, divided by the population.

Primary healthcare

The primary and community healthcare sector includes services that:

- provide the first point of contact with the health system
- have a particular focus on illness prevention or early intervention
- are intended to maintain people's independence and maximise their quality of life through care and support at home or in local community settings.

Primary Health Networks

Primary Health Networks (PHNs) are a national network of independent primary health care organisations (replacing MLs from 1 July 2015) with the objective to improve the efficiency and effectiveness of medical services for patients at risk of poor health outcomes and to improve coordination of care, particularly for those with chronic and complex conditions.

Prevalence

The proportion of the population suffering from a disorder at a given point in time (point prevalence) or given period (period prevalence).

Public health

The organised, social response to protect and promote health and to prevent illness, injury and disability. The starting point for identifying public

health issues, problems and priorities, and for designing and implementing interventions, is the population as a whole or population subgroups. Public health is characterised by a focus on the health of the population (and particular at-risk groups) and complements clinical provision of healthcare services.

Recognised immunisation

provider

A provider recognised by DHS Medicare as a provider of immunisation to children.

Recognised specialist

A medical practitioner classified as a specialist by the Medical Board of Australia and on the DHS Medicare database earning at least half of his or her income from relevant specialist items in the schedule, having regard to the practitioner's field of specialist recognition.

Screening

The performance of tests on apparently well people to detect a medical condition earlier than would otherwise be possible.

Triage category

The urgency of the patient's need for medical and nursing care:

- category 1 resuscitation (immediate within seconds)
- category 2 emergency (within 10 minutes) • category 3 — urgent (within 30 minutes) • category 4 — semi-urgent (within 60 minutes)
- category 5 non-urgent (within 120 minutes).

Vocationally registered general practitioner

A medical practitioner who is vocationally registered under s.3F of the Health Insurance Act 1973 (Cwlth), holds Fellowship of the RACGP, ACRRM, or equivalent, or holds a recognised training placement, and who has at least half of the schedule fee value of his/her DHS Medicare billing from non-referred attendances.

List of attachment tables

Attachment tables are identified in references throughout this chapter by a '10A' prefix (for example, table 10A.1). Attachment tables are available on the website (www.pc.gov.au/rogs/2016).

| Table 10A.1 Table 10A.2 | Recurrent expenditure on primary and community health by source of funds and area of expenditure, 2013-14 (2013-14 dollars) (\$ million) Types of encounter where a payment source was recorded, 2014-15 | | | | | | | |

10A Primary and community health — attachment

Definitions for the indicators and descriptors in this attachment are in section 10.5 of the chapter. Unsourced information was obtained from the Australian, State and Territory governments.

Data in this Report are examined by the Health Working Group, but have not been formally audited by the Secretariat.

Data reported in the attachment tables are the most accurate available at the time of data collection. Historical data may have been updated since the last edition of RoGS.

This file is available on the web page (www.pc.gov.au/rogs/2016).

- (a) Excludes expenditure on public health and taxation rebates for medical expenses.
- (b) Data are for funding provided by the Australian Government, State and Territory governments, local government authorities and major non-government health care funding sources. Data do not represent total expenditure on health goods and services.
- (c) Components may not add to totals due to rounding.
- (d) Expenditure on health goods and services by workers compensation and compulsory third-party motor vehicle insurers, as well as other sources of income (for example, rent, interest earned) for service providers.
- (e) 'Other' denotes 'other recurrent health services not elesewhere classified'.
 - Nil or rounded to zero.

- (a) An encounter is any professional interchange between a patient and a GP or other health professional (other health professionals include practice nurses, Aboriginal health workers and allied health service professionals).
- (b) One Medicare item number counted per encounter (where applicable).
- (c) Data missing payment source removed from analysis (n=8760).
- (d) Number of encounters after post stratification weighting for GP activity and GP age and sex.
- (e) Numbers may not add to totals due to rounding
- (f) Direct encounters are encounters where the patient is seen by the health professional. Includes direct encounters at which either a GP or other health professional item (or both) was recorded.
- (g) Indirect encounters are encounters where the patient is not seen but a service is provided (for example, a prescription or referral). Includes indirect encounters involving a GP or other health professional (or both). Includes twelve encounters involving chronic disease management or case conference items.
 - .. Not applicable. Nil or rounded to zero.

| 2012-13 | \$ | 313.9 | 301.1 | 315.2 | 239.3 | 295.1 | 272.4 | 237.3 | 231.8 | 298.7 |
| 2013-14 | \$ | 316.4 | 304.4 | 317.9 | 242.6 | 298.3 | 273.4 | 233.2 | 241.4 | 301.3 |
| 2014-15 | \$ | 326.1 | 314.3 | 331.1 | 256.8 | 307.9 | 280.5 | 242.4 | 268.9 | 312.3 |

ASR = age standardised rate. **DHS** = Department of Human Services (Australian Government).

- (a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.
- (b) Data include expenditure through DHS Medicare and the DVA. Data exclude expenditure on the Practice Incentives Program (PIP), the General Practice Immunisation Incentive Scheme (GPII) and Medicare Locals (ML). Data are not comparable with data in table 10A.4 that include this expenditure.
- (c) Some primary care services are provided by salaried GPs in community health services, particularly in rural and remote areas, through emergency departments and Aboriginal community controlled health services (ACCHSs). Consequently, expenditure reported through Medicare fee-for-service statistics will be understated in jurisdictions with larger proportions of rural and remote populations.
- (d) Data quality information (DQI) for some data in this table can be found at www.pc.gov.au/rogs/2016.
- (e) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to identify GPs.
- (f) Fee-for-service expenditure per person is directly age standardised to the 2001 Australian standard population.
- (g) Rates are derived using the ABS estimated resident population (ERP) for December 31 of the reference year. The ERP is the first preliminary ERP based on the 2011 Census.

Source: Department of Health unpublished, MBS statistics; DVA unpublished; table 10A.110.

⁽a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.

- (c) Data include fee-for-service expenditure through DHS Medicare and the Department of Veterans' Affairs (DVA) as well as expenditure on: the Practice Incentives Program (PIP); the General Practice Immunisation Incentive Scheme (GPII) for 2012-13 and previous years; and, the Divisions of General Practice Program (DGPP) for 2011-12 and previous years. From 2012-13, total expenditure data include core operational expenditure on Medicare Locals.
- (d) DVA data include expenditure on specialist GPs. Other data include expenditure on vocationally registered GPs and other medical practitioners (OMPs).
- (e) Some primary care services are provided by salaried GPs in community health services, particularly in rural and remote areas, through emergency departments and Aboriginal community controlled health services (ACCHSs). Consequently, expenditure will be understated in jurisdictions with larger proportions of rural and remote populations.
- (f) Data quality information (DQI) for some data in this table can be found at www.pc.gov.au/rogs/2016.

⁽b) Rates are derived using the ABS estimated resident population (ERP) for December 31 of the reference year. The ERP is final rebased to the 2011 Census for 2010-11 and is the first preliminary ERP based on the 2011 Census for subsequent years.

| | | | | | | | | | | |

- (a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.
- (b) State and Territory level data are only available on a cash basis for general, concessional and doctor's bag categories. These figures are not directly comparable to those published in the Department of Health annual report which are prepared on an accrual accounting basis and also include other categories administered under special arrangements (such as medicines supplied in bulk to remote and very remote areas under s.100 of the *National Health Act 1953* [Cwlth] costing \$29.3 million for 2014-15, of which the NT accounted for 51.7 per cent [table 10A.7]).
- (c) A DHS reconciliation process may result in some variance in data for 2014-15.
- (d) PBS total includes PBS general ordinary, general safety net, concessional ordinary, concessional safety net and doctor's bag.
- (e) RPBS includes RPBS general ordinary and RPBS general safety net.
- (f) PBS expenditure per person exclude RPBS and doctor's bag.
- (g) Rates from 2012-13 are derived using ERPs based on the 2011 Census. Rates for previous years are derived using ERPs based on earlier Censuses. Rates based on different Censuses are not comparable.

- (a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.
- (b) State and Territory level data are only available on a cash basis for general, concessional and doctor's bag categories. These figures are not directly comparable to those published in the Department of Health annual report which are prepared on an accrual accounting basis and also include other categories administered under special arrangements (such as medicines supplied in bulk to remote and very remote areas under s.100 of the *National Health Act 1953* [Cwlth] costing \$29.3 million for 2014-15, of which the NT accounted for 51.7 per cent [table 10A.7]).
- (c) A DHS reconciliation process may result in some variance in data for 2014-15.
- (d) PBS total includes PBS general ordinary, general safety net, concessional ordinary, concessional safety net and doctor's bag.
- (e) RPBS includes RPBS general ordinary and RPBS general safety net.
- (f) PBS expenditure per person exclude RPBS and doctor's bag.
- (g) Rates from 2012-13 are derived using ERPs based on the 2011 Census. Rates for previous years are derived using ERPs based on earlier Censuses. Rates based on different Censuses are not comparable.

⁽a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.

- (b) Includes expenditure on PBS medicines supplied in bulk under s.100 of the *National Health Act 1953* (Cwlth) to Aboriginal Health Services in remote and very remote areas.
- (c) This program seeks to address identified barriers to accessing essential medicines experienced by Aboriginal and Torres Strait Islander people living in remote areas (see http://www.health.gov.au/internet/main/publishing.nsf/Content/health-pbs-indigenous-faq, accessed 15 December 2015).
- (d) Allocation to state and territory is based on location of the Aboriginal Health Service. Clients are not necessarily resident in the same state or territory.
 - Nil or rounded to zero.

DVA = Department of Veterans' Affairs

- (a) 'Department of Health and other' comprises Department of Health funded expenditure such as on MBS and PBS, and other Australian Government expenditure such as for the SPP associated with the National Healthcare Agreement and health-related NP payments, capital consumption, estimates of the medical expenses tax offset, and health research not funded by Department of Health.
- (b) Includes the 30–40 per cent rebate on health insurance premiums that can be either claimed directly from the Australian Government through the taxation system or may involve a reduced premium being charged by the private health insurance fund.
 - Nil or rounded to zero.

FSE = Full Service Equivalent. 1 FSE is approximately equivalent to a 37.5 hour working week.

- (a) Data include vocationally registered GPs and other medical practitioners (OMPs).
- (b) GP numbers are based on doctors' major practice postcodes as at the last quarter of the reference period. The major practice postcode is the location at which a doctor rendered the most services. FSE numbers are based on doctors' practice location postcodes at which services were rendered within the reference period.
- (c) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to compute the number of GPs (associated with a small reduction in historical data for the number of GPs) and use of a new proxy measure for hours worked (FSE) in place of the previously used 'Full time Workload Equivalents' (FWE).
- (d) Full Service Equivalent (FSE) is an estimated measure of medical workforce based on Medicare claims information. FSE models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.
- (e) Rates are derived using the ABS ERP for 31 December. For 2011-12 and subsequent years, the first preliminary ERP based on the 2011 Census is used. For 2010-11 and previous years, the final 2011 Census rebased ERP is used.

- (a) Data do not capture medicines supplied by Aboriginal Health services in remote and very remote areas to their clients under s.100 of the *National Health Act 1953* (Cwlth). Care should be taken in using data for the NT as around 43 per cent of the population live in remote and very remote areas.
- (b) Rates for 2012-13 and subsequent years are derived using ERPs based on the 2011 Census. Rates for previous years are derived using ERPs based on earlier Censuses. Rates based on different Censuses are not comparable.
- (c) A DHS reconciliation process may result in some variance in data for 2014-15.
- (d) Includes PBS general ordinary, general free safety net, concessional ordinary, concessional free safety net and doctor's bag.
- (e) Includes RPBS general ordinary and RPBS general safety net.
- (f) PBS services per person exclude RPBS and doctor's bag.

Care should be taken in using data for the NT as around 43 per cent of the population live in remote and very remote areas.
- (b) A DHS reconciliation process may result in some variance in data for 2014-15.
- (c) Includes PBS general ordinary, general free safety net, concessional ordinary, concessional free safety net and doctor's bag.
- (d) Includes RPBS general ordinary and RPBS general safety net.
- (e) PBS services per person exclude RPBS and doctor's bag.
- (f) Rates from 2012-13 are derived using ERPs based on the 2011 Census. Rates for previous years are derived using ERPs based on earlier Censuses. Rates based on different Censuses are not comparable.

⁽a) Data are sourced from an annual report on the Alcohol and Other Drug Treatment Services National Minimum Data Set (AODTS-NMDS) — a collection of data from publicly funded government and non-government treatment services. Treatment activities are excluded from that collection if the agencies provide medication for dependence on opioid drugs such as heroin (opioid pharmacotherapy treatment) where no other treatment is provided, are located within prisons or detention centres, or in acute care and psychiatric hospitals providing treatment only to admitted patients. While in scope, the majority of primary healthcare services for Aboriginal and Torres Strait Islander Australians that are funded by the Australian government do not report to the AODTS-NMDS.

- (b) Includes only services that receive public funding.
- (c) WA has a number of integrated services that include both government and non-government providers.
- (d) Includes agencies funded by Department of Health under the Non-Government Organisation Treatment Grants Program.
- (e) Total includes episodes for people of unknown sex.
 - Nil or rounded to zero.

⁽a) Includes only Aboriginal and Torres Strait Islander primary healthcare services that report data for the Online Services Report (OSR; previously the OATSIH Services Report).

- (c) The number of services that provide OSR data can change each year. Changes can be due to a number of reasons including: new Australian government funded primary health care services opening; existing services gaining Australian government funding; previously excluded Australian government funded services commencing OSR data reporting where changes to the types of services provided and/or to reporting arrangements are made.
- (d) An episode of care involves contact between an individual client and service staff for the provision of health care. Group work is not included. Transport is included only if it involves provision of health care/information by staff. Outreach provision, for example episodes at outstation visits, park clinics, is included. Episodes of health care delivered over the phone are included.

- (a) Includes only Aboriginal and Torres Strait Islander primary healthcare services that report data for the Online Services Report (OSR; previously the OATSIH Services Report).
- (b) Data are for Aboriginal and Torres Strait Islander primary healthcare services funded or partially funded by the Australian Government to facilitate access to primary health care. Data for these services are collected through the Online Services Report (OSR) questionnaire. Many receive additional funding from State and Territory governments and other sources. OSR data reported here represent funding from all sources.
- (c) Data may differ from data presented in the national OSR report which excludes drivers/field officers reported here.

Table 10A.19 Full time equivalent (FTE) health staff employed by Aboriginal and Torres Strait Islander primary healthcare services which provide data for Online Services Reporting (OSR) as at 30 June (number) (a), (b), (c), (d)

2010 2011 2012 2013 2014

- (d) The number of services that provide OSR data can change each year. Changes can be due to a number of reasons including: new Australian government funded primary health care services opening; existing services gaining Australian government funding; previously excluded Australian government funded services commencing OSR data reporting where changes to the types of services provided and/or to reporting arrangements are made.
- (e) Data for Aboriginal health practitioners, Tobacco workers/coordinators and Health promotion/ prevention workers were first collected for 2013.
- (f) Other social and emotional wellbeing staff includes: Bringing Them Home and Link Up support workers, psychologists, mental health workers and other social and emotional wellbeing staff.
- (g) Allied health professionals include diabetes educators and other patient educators, health program coordinators, nutrition workers, community care workers, child and family health workers, child protection workers, welfare workers, pharmacy assistants/technicians, Brighter Futures Program caseworkers, foster carers, Healthy for Life workers, sports and recreation workers, youth workers, and masseurs.
- (h) Other health staff' include: outreach workers, special program support workers, patient liasion officers, and other health-related positions.
- (i) Totals may not add due to rounding and cell suppression.
- (j) Totals include health staff for whom Indigenous status was not provided.

- (a) Geolocation based on the Pharmacy Access/Remoteness Index of Australia (PhARIA). PhARIA is a composite index of accessibility that incorporates measures of remoteness and measures of professional isolation (represented by the road distance to the five closest pharmacies). The PhARIA classification categories are:
 - Category 1 Highly Accessible
 - Category 2 Accessible (Group A)
 - Category 3 Accessible (Group B)
 - Category 4 Moderately Accessible
 - Category 5 Remote
 - Category 6 Very Remote

PhARIA 1 represents 'urban' and PhARIA 2-6 'rural' for the purpose of these data.

- (b) Rates are derived using 2011 Census population data.
- (c) Includes other territories.
- (d) A GP can obtain approval under S92 of the *National Health Act 1953* (Cwlth) to supply PBS medicines to people in the area in which they practise if it is deemed to be an area that lacks a convenient and efficient pharmaceutical service.
- (e) PBS approved private hospitals supply medicines to patients of the hospital (inpatients and outpatients), while public hospitals provide medicines only to patients on discharge.
- (f) Aboriginal Medical Services in remote and very remote areas can obtain approval to supply PBS medicines to patients under S100 of the *National Health Act 1953* (Cwlth). Remote and very remote areas are as defined in the Rural, Remote and Metropolitan Areas Classifications (RRMA), 1991 Census Edition.
 - .. Not applicable. Nil or rounded to zero.

(a) Geolocation based on the Pharmacy Access/Remoteness Index of Australia (PhARIA). PhARIA is a composite index of accessibility that incorporates measures of remoteness and measures of professional isolation (represented by the road distance to the five closest pharmacies). The PhARIA classification categories are:

Category 1 - Highly Accessible

Category 2 - Accessible (Group A)

Category 3 - Accessible (Group B)

Category 4 - Moderately Accessible

Category 5 - Remote

Category 6 - Very Remote

PhARIA 1 represents 'urban' and PhARIA 2-6 'rural' for the purpose of these data.

- (b) Rates are derived using 2011 Census population data for 2012 and subsequent years and 2006 Census population data for 2011 and previous years.
- (c) For 2013, one public hospital in NSW is a campus of a Victorian hospital participating in the Pharmaceutical Reforms.
- (d) Care should be taken using data for the NT, as around 43 per cent of the population live in remote and very remote areas and data exclude Aboriginal Medical Services that supply medications in these areas under s.100 of the *National Health Act 1953* (Cwlth).
- (e) Includes other territories.
- (f) 118 pharmacies classified as rural at 30 June 2012 were reclassified as urban at 30 June 2013.
- (g) A GP can obtain approval under S92 of the *National Health Act 1953* (Cwlth) to supply PBS medicines to people in the area in which they practise if they are able to demonstrate that the area lacks a convenient and efficient pharmaceutical service. This criterion cannot be met in 'urban' areas.
- (h) PBS approved private hospitals supply medicines to patients of the hospital (inpatients and outpatients), while public hospitals provide medicines only to patients on discharge.
- (i) There were no PBS approved private hospitals in rural areas in the reference years reported.
 - .. Not applicable. Nil or rounded to zero.

REPORT ON GOVERNMENT SERVICES 2016

Table 10A.22 PBS expenditure per person, by remoteness area (2014-15 dollars) (a), (b), (c), (d), (e)

| | Unit | 2012-13 | 2013-14 | 2014-15 |
|-----------------------|------|---------|---------|---------|
| Total expenditure | | | | |
| Major cities | \$m | 4 916.2 | 5 009.5 | 4 765.1 |
| Inner regional | \$m | 1 571.6 | 1 600.7 | 1 533.8 |
| Outer regional | \$m | 702.9 | 709.7 | 677.1 |
| Remote | \$m | 69.8 | 71.1 | 68.1 |
| Very remote | \$m | 25.2 | 25.5 | 24.3 |
| Australia (f) | \$m | 7 288.1 | 7 418.7 | 7 071.7 |
| Expenditure per perso | on | | | |
| Major cities | \$ | 308.1 | 307.0 | 286.9 |
| Inner regional | \$ | 378.7 | 379.6 | 359.5 |
| Outer regional | \$ | 343.5 | 343.4 | 325.3 |
| Remote | \$ | 218.2 | 220.3 | 210.3 |
| Very remote | \$ | 120.7 | 121.9 | 116.5 |
| Australia (f) | \$ | 321.3 | 320.7 | 301.0 |

- (a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.
- (b) Includes PBS general ordinary, general safety net, concessional ordinary, concessional free safety net and unknown free safety net. Excludes RPBS and doctor's bag.
- (c) Locality level data are only available on a cash accounting basis for general and concessional categories. These figures may differ from those published in the Department of Health annual report which are prepared on an accrual accounting basis and also include doctor's bag and other categories administered under special arrangements (such as medicines supplied in bulk to remote and very remote areas under s.100 of the *National Health Act 1953* [Cwlth].) Expenditure on medications dispensed to remote and very remote areas under s.100 was \$29.4 million in 2014-15 (table 10A.7).
- (d) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification and are not comparable with data for previous years which were based on a different classification.
- (e) Rates are derived using the final ABS 2011 Census based estimated resident population (ERP). Rates in this table use the 30 June ERP preceding the reference year and differ from rates reported in tables 10A.5 and 10A.6 which use the 31 December ERP for the reference year.
- (f) Data for Australia includes Other Territories and expenditure that could not be allocated to a remoteness area.

FSE = Full Service Equivalent. 1 FSE is approximately equivalent to a a 37.5 hour working week.

- (a) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification and are not comparable with data for previous years, which are based on a different classification.
- (b) There are no very remote areas in Victoria; no major cities in Tasmania; no outer regional or remote areas in the ACT; and no inner regional or major cities in the NT.
- (c) Data include vocationally registered GPs and other medical practitioners (OMPs).
- (d) GP numbers are based on doctors' major practice postcodes as at the last quarter of the reference period. The major practice postcode is the location at which a doctor rendered the most services. FSE numbers are based on doctors' practice location postcodes at which services were rendered within the reference period.
- (e) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to compute the number of GPs (associated with a small reduction in historical data for the number of GPs) and use of a a new proxy measure for hours worked (FSE) in place of the previously used 'Full time Workload Equivalents' (FWE).
- (f) Full Service Equivalent (FSE) is an estimated measure of medical workforce based on Medicare claims information. FSE models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.
- (g) For the ACT, inner regional area data are not reported for confidentiality reasons, but are included in major cities data.
 - .. Not applicable. **np** Not published.

FSE = Full Service Equivalent. 1 FSE is approximately equivalent to a a 37.5 hour working week.

⁽a) Data include vocationally registered GPs and other medical practitioners billing DHS Medicare.

⁽b) GP numbers are based on doctors' major practice postcodes as at the last quarter of the reference period. The major practice postcode is the location at which a doctor rendered the most services. FSE numbers are based on doctors' practice location postcodes at which services were rendered within the reference period.

⁽c) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to compute the number of GPs (associated with a small reduction in historical data for the number of GPs) and use of a new proxy measure for hours worked (FSE) in place of the previously used 'Full time Workload Equivalents' (FWE).

Table 10A.25 Availability of female GPs (a), (b), (c), (d)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

- (d) Full Service Equivalent (FSE) is an estimated measure of medical workforce based on Medicare claims information. FSE models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.
- (e) Rates are derived using the ABS female ERP for 31 December of the reference year. From 2011-12, the first preliminary ERP based on the 2011 Census is used. For 2010-11 and previous years, the final 2011 Census rebased ERP is used.

FSE = Full Service Equivalent. 1 FSE is approximately equivalent to a a 37.5 hour working week.

⁽a) Data include vocationally registered GPs and other medical practitioners billing DHS Medicare.

⁽b) GP numbers are based on doctors' major practice postcodes as at the last quarter of the reference period. The major practice postcode is the location at which a doctor rendered the most services. FSE numbers are based on doctors' practice location postcodes at which services were rendered within the reference period.

⁽c) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to compute the number of GPs (associated with a small reduction in historical data for the number of GPs) and use of a new proxy measure for hours worked (FSE) in place of the previously used 'Full time Workload Equivalents' (FWE).

Table 10A.26 Availability of male GPs (a), (b), (c), (d)

| Unit NSW Vic Qld WA SA Tas ACT NT | Aust |
|-----------------------------------|------|
|-----------------------------------|------|

- (d) Full Service Equivalent (FSE) is an estimated measure of medical workforce based on Medicare claims information. FSE models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.
- (e) Rates are derived using the ABS male ERP for 31 December of the reference year. From 2011-12, the first preliminary ERP based on the 2011 Census is used. For 2010-11 and previous years, the final 2011 Census rebased ERP is used.

FTE = Full Time Equivalent. FTE based on a 40-hour week.

- (a) Data include dentists employed in the dentist workforce, on extended leave and looking for work in the dentist workforce.
- (b) For 2014, data are based on all clinical hours worked in the public sector, including by those who also work in the private sector. For 2013 and previous years, data are for dentists working in the public sector only in public dental hospitals, school dental services, general dental services, defence forces, tertiary education and 'other public' areas; hours worked by dentists working in both public and private sectors are excluded. This constitutes a break in time series. Data for 2014 are not comparable with data for previous years.
- (c) Remoteness areas for 2012 and subsequent years are defined using the Australian Statistical Geography Standard (ASGS), based on the ABS 2011 Census of population and housing. Remoteness areas for 2011 are defined using the Australian Standard Geographical Classification (ASGC), based on the ABS 2006 Census of population and housing.
- (d) Allocation to State or Territory is derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details are unavailable, state and territory of residence is used. Where none of these is available, location is coded 'unstated'. Data for Australia include location unstated.
- (e) Allocation to region is based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postcode of residence is used. Where none of these is available, location is coded 'unstated' and data are included in 'Total'.
- (f) There are no major cities in Tasmania; no outer regional, remote or very remote areas in the ACT; and no major cities or inner regional areas in the NT.
- (g) Data for Australia include those with location 'unstated'.
- (h) FTE based on a 40-hour week.
- (i) Data for 2011 are for total hours worked by dentists employed in the public sector and include provisional registrants. Dentists working in both the public and the private sector are excluded.
- (j) Remote and very remote includes Migratory areas.
- (k) Total includes those with remoteness area unstated.

FTE = Full Time Equivalent. FTE based on a 40-hour week.

- (a) Data include dental hygienists and dental therapists who are employed, on extended leave and looking for work, in the dental hygiene and dental therapy workforces, respectively. Dual registered practitioners (those registered as both dental therapists and dental hygienists) are included in dental therapists data and are excluded from dental hygienists data.
- (b) For 2014, data are based on all clinical hours worked in the public sector, including by those who also work in the private sector. For 2013 and previous years, data are for those working in the public sector only in public dental hospitals, school dental services, general dental services, defence forces, tertiary education and 'other public' areas; those working in both public and private sectors are excluded. This constitutes a break in time series. Data for 2014 are not comparable with data for previous years.
- (c) Remoteness areas for 2012 and subsequent years are defined using the Australian Statistical Geography Standard (ASGS), based on the ABS 2011 Census of population and housing. Remoteness areas for 2011 are defined using the Australian Standard Geographical Classification (ASGC), based on the ABS 2006 Census of population and housing.
- (d) Allocation to State or Territory is derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details are unavailable, state and territory of residence is used. Where none of these is available, location is coded 'unstated'. Data for Australia include location unstated.

Table 10A.29 Availability of public Occupational Therapists and Psychologists (per 100 000 people) (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)

NSW Vic Qld (k) WA (k) SA (k) Tas (l) ACT (l) NT (l) Aust (m)

- (a) For 2014, data are based on hours worked in a clinical role (occupational therapists) or direct client services role (psychologists) in the public sector, including by those who also work in the private sector. For 2013 and previous years, data are for practitioners working in the public sector only and exclude practitioners who work in both the public and private sectors. This constitutes a break in time series. Data for 2014 are not comparable with data for previous years.
- (b) For Occupational Therapists, data for 2013 and previous years are for clinical hours worked by occupational therapists employed in the public sector and exclude practitioners who work in both the public and private sectors.
- (c) For Psychologists:
 - data for 2011 are based on total hours worked only by practitioners employed in the public sector
 - data for 2012 are based on clinical hours worked only by practitioners employed in the public sector
 - data for 2013 are based on hours worked in a direct client service role only by practitioners employed in the public sector.
- (d) Data exclude provisional registrants.
- (e) Historical data have been revised and may differ from prevous reports.
- (f) Occupational therapists joined the National Registration and Accreditation Scheme (NRAS) 1 July 2012. Data are not available for previous years.
- (g) Remoteness areas are defined using the Australian Statistical Geography Standard (ASGS), based on the ABS 2011 Census of population and housing.
- (h) Allocation to State or Territory is by location of main job where available. Otherwise, location of principal practice is used as a proxy. If that is also not available, location of residence is used. If none of these are available, location is coded 'unstated' and data are included for Australia.
- (i) Allocation to region is based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postcode of residence is used. Where none of these is available, location is coded 'unstated' and data are included in 'Total'.
- (j) FTE based on a 38-hour week.
- (k) Occupational therapist workforce data are not available for 2012 for Queensland, WA or SA. Due to transitional arrangements to the National Registration and Accreditation Scheme, many occupational therapists were not required to renew their registration and so did not complete a workforce survey.
- (I) There are no major cities in Tasmania; no outer regional, remote or very remote areas in the ACT; and no major cities or inner regional areas in the NT.
- (m) Data for Australia include those with location 'unstated'.
- (n) Remote/very remote includes Migratory areas.
- (o) Total includes those with remoteness area unstated.

Table 10A.30 Annual health assessments for older people by Indigenous status (per cent) (a), (b), (c), (d), (e), (f)

Unit NSW Vic Qld WA SA Tas ACT NT Aust (a) Older people are defined as Aboriginal and Torres Strait Islander people aged 55 years or over and non-Indigenous people aged 75 years or over, excluding

- people living in residential aged care facilities.
- (b) Indigenous status is determined by self-identification. Aboriginal and Torres Strait Islander people aged 75 years or over may have received a health assessment under the 'all older people' MBS items. This is considered unlikely to affect overall proportions significantly, due to the relatively low average life expectancy of Aboriginal and Torres Strait Islander people.
- (c) Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander Australians are therefore likely to understate the proportion who access health assessments.
- (d) Excludes services that qualify under the DVA National Treatment Account and services provided in public hospitals.
- (e) Allocation of patients to state or territory is based on the final claim processed for each patient in the reference period. Data are for number of patients receiving a health assessment rather than number of health assessments provided.
- (f) Rates have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.1 and 2A.13-14) for details.
- (g) Includes claims for MBS items 704, 706 and 715, for Aboriginal and Torres Strait Islander people aged 55 years or over.
- (h) Derived population of Aboriginal and Torres Strait Islander people aged 55 years or over at 31 December, computed by averaging the estimates/projections at 30 June at each end of the reference year. Historical data have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.1 and 2A.13-14) for details.
- (i) Includes claims for MBS items 700, 702, 701, 703, 705 and 707, for people aged 75 years or over.
- (j) Estimated population of non-Indigenous people aged 75 years or over as at 31 December, computed by subtracting the derived population of Aboriginal and Torres Strait Islander people aged 75 or over (see footnote (h)) from the December 31 ERP for all Australians aged 75 years or over. Historical data have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. Non-Indigenous population estimates are available for census years only. For inter-censal years, experimental estimates and projections data for the Aboriginal and Torres Strait Islander population are derived using various assumptions. These can be used to derive denominators for calculating non-Indigenous rates for the inter-censal years. However, such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

- (a) Older Aboriginal and Torres Strait Islander people are defined as aged 55 years or over, excluding people living in residential aged care facilities.
- (b) Includes claims for MBS items 704, 706 and 715 for Aboriginal and Torres Strait Islander people aged 55 years or over. Indigenous status is determined by self-identification. Aboriginal and Torres Strait Islander people aged 75 years or over may have received a health assessment available to 'all older people'. This is considered unlikely to affect overall proportions significantly, due to the relatively low average life expectancy of Aboriginal and Torres Strait Islander people.
- (c) Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander people. Data for Aboriginal and Torres Strait Islander people are therefore likely to understate the proportion who access health assessments.
- (d) Excludes services that qualify under the DVA National Treatment Account and services provided in public hospitals.
- (e) Allocation of patients to state or territory is based on the final claim processed for each patient in the reference period. Data are for number of patients receiving a health assessment rather than number of health assessments provided.
- (f) Target population is the derived population of Aboriginal and Torres Strait Islander people aged 55 years of over at 31 December, computed by averaging the estimates/projections at 30 June at each end of the reference year. Historical data have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.1 and 2A.13-14) for details.

⁽a) Older people are defined as Aboriginal and Torres Strait Islander people aged 55 years or over and non-Indigenous people aged 75 years or over, excluding people living in residential aged care facilities.

- (c) Allocation to State/Territory is based on the final claim processed for each patient in the reference period. Data are for number of patients receiving a health assessment rather than number of health assessments provided.
- (d) Rates have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.2 and 2A.13-14) for details.
- (e) Derived target populations as at 31 December are computed as the average of the population estimates / projections at June 30 at each end of the reference year. Historical data have been revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.2 and 2A.13-14) for details.

| Proportion of target population assessed | % | 70.9 | 28.6 | 79.8 | 53.3 | 57.7 | 53.3 | 49.3 | 66.9 | 58.9 |

a) Computed by the Secretariat for 2011-12 and subsequent years. Historical data were sourced from the National Healthcare Agreement and do not include underlying data. The considerable increase in proportion of target population assessed compared to previous years is associated with a considerable increase in the number of children receiving fourth year developmental health checks (Department of Health, pers. comm, 25 October 2012).

⁽b) Reference year is based on the date the service was provided. Data may differ from other reports in which reference year is based on the date the claim was processed.

Table 10A.34 Proportion of children receiving a fourth year developmental health check, by type of health check (per cent) (a), (b), (c), (d), (e), (f)

| Unit | NSW | Vic | Qld (g) | WA | SA | Tas (h) | ACT (h) | NT (g) | Aust (h) |
|------|-----|-----|---------|----|----|---------|---------|--------|----------|
| | | | | | | | | | |

- (c) Allocation to State/Territory is based on patient postcode at the date their last service was processed in the reference period. This is not necessarily where the service was received. Data are for number of patients receiving a health assessment/check rather than number of health assessments/checks provided.
- (d) Children are counted only once in the numerator.
- (e) From the 2010-11 reference period, children who received both a healthy kids check and an Aboriginal and Torres Strait Islander people's health assessment during the reference period are counted against the Aboriginal and Torres Strait Islander health assessment.
- (f) Target 4 year old population is as at 31 December of the reference year. For Aboriginal and Torres Strait Islander health checks, the target population is computed as the average of the 4 year old population estimates / projections at June 30 at each end of the reference year. For the Healthy Kids Check, the target non-Indigenous population is computed by subtracting the derived population of Aboriginal and Torres Strait Islander 4 year olds from the 4 year old ERP. Historical data are revised to the ABS' final 2011 Census rebased estimates and projections and may differ from previous reports. See chapter 2 (tables 2A.2 and 2A.13-14) for details.
- (g) For the NT for 2013-14 and 2014-15, and for Queensland for 2014-15, data for the proportion of Aboriginal and Torres Strait Islander children who received a health check exceeds 100 per cent. This is largely because numerator and denominator are not directly comparable children are eligible to receive this health assessment at the age of 3, 4 or 5 years. However, a child is eligible to receive it once only (children may also be eligible for other health checks) hence, the denominator uses population estimates and projections for a single year of age 4 years. Using this methodology, the total number of children aged 3, 4 and 5 years who received a check in 2013-14 exceeds the derived population of Aboriginal and Torres Strait Islander children aged 4 years.
- (h) Data for Aboriginal and Torres Strait Islander Child Health Checks are not published for Tasmania or the ACT for 2009-10 due to small numbers, but are included in the total for Australia.
- (i) Includes claims for Medicare Benefits Schedule (MBS) Item 708 (Aboriginal and Torres Strait Islander Child Health Check, available to 30 April 2010) and Item 715 (Aboriginal and Torres Strait Islander People's Health Assessment, available from 1 May 2010) for children aged 3, 4 or 5 years for 2012-13 and subsequent years, and aged 3 or 4 years for 2011-12 and previous years. Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander people. Data for Aboriginal and Torres Strait Islander people are therefore likely to understate the proportion who access health assessments.

REPORT ON GOVERNMENT SERVICES 2016 PRIMARY AND COMMUNITY HEALTH PAGE **4** of TABLE 10A.34 Table 10A.34 Proportion of children receiving a fourth year developmental health check, by type of health check (per cent) (a), (b), (c), (d), (e), (f)

Unit NSW Vic Qld (g) WA SA Tas (h) ACT (h) NT (g) Aust (h)

- (j) Includes claims for MBS items 709 and 711 (Healthy Kids Check, available to 30 April 2010) and items 701, 703, 705, 707 and 10986 (Health Assessment, available from 1 May 2010) for children aged 3, 4 or 5 years for 2011-12 and subsequent years, and aged 3 or 4 years for 2010-11 and previous years. Data do not include developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres. This is known to be a particular issue for several jurisdictions. For example, in Victoria, the Victorian Maternal and Child Health Service provided a 3.5 year old Key Ages and Stages consultation to 47 638 children in the 2011-12 financial year. Data include Aboriginal and Torres Strait Islander children who received a Healthy Kids Check and did not also receive a health check under MBS items 708 or 715.
- (k) Data for 2011-12 and subsequent years include Aboriginal and Torres Strait Islander and non-Indigenous children aged 3, 4 or 5 years who received a health assessment under the specified MBS items, provided they had not received such a check in a previous reference year. This constitutes a break in time series for the data. Data from 2011-12 should not be compared with data for 2010-11 and previous years, which are limited to children aged 3 or 4 years.

np Not published.

⁽a) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification.

- (b) Data include non-referred attendances undertaken by general practice nurses
- (c) Patient age as at date of service.
- (d) Allocation to remoteness area based on patients' Medicare enrolment postcode.
- (e) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to identify GPs.
- (f) Australia includes attendances where patient postcodes could not be allocated to a remoteness area.
- (g) All ages includes attendances where patient age is unknown.

⁽a) Data include non-referred attendances undertaken by general practice nurses.

Source: Department of Health unpublished, MBS Statistics.

⁽b) Patient age as at date of service.

⁽c) Allocation to State/Territory based on patients' Medicare enrolment postcode.

⁽d) All ages includes attendances where patient age is unknown.

⁽e) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to identify GPs.

⁽f) Australia includes attendances where patient postcodes could not be allocated to a State/Territory.

Table 10A.37 People deferring access to GPs due to cost (per cent) (a), (b), (c), (d), (e), (f), (g)

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT | NT (f) | Aust |
|------------------------------------|----------|-----|-----|-----|-----|------|------|------|--------|------|
| 2012-13 | | | | | | | | | | |
| Proportion | % | 4.5 | 5.0 | 5.9 | 7.7 | 5.4 | 7.0 | 8.8 | 5.2 | 5.4 |
| RSE | % | 8.7 | 6.3 | 7.0 | 7.4 | 9.5 | 9.6 | 12.1 | 20.5 | 3.3 |
| 95 per cent confidence interval | <u>+</u> | 0.8 | 0.6 | 0.8 | 1.1 | 1.0 | 1.3 | 2.1 | 2.1 | 0.4 |
| 2013-14 (g) | | | | | | | | | | |
| Proportion | % | 3.5 | 5.0 | 5.8 | 6.2 | 4.5 | 6.9 | 6.9 | 5.6 | 4.9 |
| RSE | % | 7.6 | 6.9 | 6.2 | 7.5 | 11.7 | 10.4 | 11.3 | 21.8 | 2.9 |
| 95 per cent confidence interval | <u>+</u> | 0.5 | 0.7 | 0.7 | 0.9 | 1.0 | 1.4 | 1.5 | 2.4 | 0.3 |
| 2014-15 (g) | | | | | | | | | | |
| Proportion | % | 3.2 | 5.6 | 5.4 | 7.0 | 5.5 | 7.0 | 9.7 | 4.1 | 5.0 |
| RSE | % | 9.0 | 7.3 | 7.9 | 9.2 | 9.3 | 11.3 | 11.7 | 22.5 | 3.1 |
| 95 per cent confidence interval | <u>±</u> | 0.6 | 0.8 | 0.8 | 1.3 | 1.0 | 1.5 | 2.2 | 1.8 | 0.3 |

- (a) People aged 15 years or over who delayed or did not visit a GP at any time in the last 12 months due to cost.
- (b) Data are crude rates and may differ from data in previous reports in which rates were age-standardised.
- (c) Rates with RSEs between 25 per cent and 50 per cent should be used with caution.
- (d) Data for 2012-13 and subsequent years are not comparable to data for previous years due to a change in question sequencing/wording. See data quality information at www.pc.gov.au/rogs/2016 for further detail.
- (e) Data are not comparable to data for Aboriginal and Torres Strait Islander people that were sourced from the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey due to differences in survey design and collection methodology.
- (f) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities, which comprise around 25 per cent of the estimated resident population of the NT.
- (g) For 2013-14 and subsequent years, cells have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

Source: ABS unpublished, Patient Experience Survey, various years, Cat. no. 4839.0.

Table 10A.38 Aboriginal and Torres Strait Islander people deferring access to GPs due to cost, 2012-13 (per cent) (a), (b), (c), (d), (e)

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|---------------------------------|----------|------|------|------|------|------|------|------|------|------|
| Proportion | % | 11.1 | 12.3 | 13.0 | 13.8 | 7.7 | 16.3 | 20.7 | 11.0 | 12.2 |
| RSE (c) | % | 24.5 | 28.4 | 26.9 | 20.7 | 43.8 | 23.9 | 24.3 | 40.2 | 10.2 |
| 95 per cent confidence interval | <u>+</u> | 5.3 | 6.9 | 6.8 | 5.6 | 6.6 | 7.6 | 9.9 | 8.7 | 2.4 |

- (a) Aboriginal and Torres Strait Islander people aged 15 years or over who reported needing to see a GP in the last 12 months and delayed doing so or did not do so because of cost, divided by the number of Aboriginal and Torres Strait Islander people aged 15 years or over who reported needing to see a GP in the last 12 months.
- (b) Rates are age-standardised to the 2001 Australian standard population using 5 year ranges.
- (c) Rates with RSEs greater than 25 per cent should be used with caution. Rates with RSEs greater than 50 per cent are considered too unreliable for general use.
- (d) Data are not comparable with data for all Australians that were sourced from the ABS Patient Experience Survey, due to differences in survey design and collection methodology.
- (e) Information on how to interpret and use the data appropriately is available from Explanatory Notes in Australian Aboriginal and Torres Strait Islander Health Survey: First Results, 2012-13 (Cat. no. 4727.0.55.001) and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, 2012-13 (Cat. no. 4727.0.55.002).

- (a) Time waited between making an appointment and seeing the GP for urgent medical care.
- (b) People aged 15 years or over who saw a GP for urgent medical care for their own health in the last 12 months. 'Urgent' as defined by respondent. Discretionary interviewer advice was to include health issues that arose suddenly and were serious (e.g. fever, headache, vomiting, unexplained rash).
- (c) Data are crude rates and may differ from data in previous reports in which rates were age-standardised.
- (d) Rates with RSEs greater than 25 per cent should be used with caution. Rates with RSEs greater than 50 per cent are considered too unreliable for general use.
- (e) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) For 2013-14 and subsequent years, cells have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

- (a) 'GP-type' emergency department presentations are defined as presentations for which the type of visit was reported as emergency presentation, which did not arrive by ambulance or by police or other correctional vehicle, with a triage category of 4 (semi-urgent) or 5 (non-urgent), and where the episode end status was not: admitted to the hospital, referred to another hospital, or died. This is an interim definition, pending development of new methodology to more closely approximate the population that could receive services in the primary care sector. Data include appropriate presentations to emergency departments that can only retrospectively be categorised as 'GP-type'.
- (b) Data are presented by the state/territory of usual residence of the patient, not by the state/territory of the hospital.
- (c) Includes all hospitals reporting to the Non-admitted patient emergency department care (NAPEDC) NMDS. Data are not comparable with data in previous reports which were limited to Peer Group A and B hospitals and the Mersey Community Hosital.
- (d) Data for the Albury Base Hospital in NSW are reported in Victorian hospital statistics.

- (a) People aged 15 years or over who reported attending a hospital emergency department and thought at the time that the care received could have been provided at a general practice.
- (b) Rates are age-standardised to the 2001 Australian standard population using 5 year age ranges except for ACT and NT, for which 15 year age ranges are used.
- (c) Excludes persons who responded 'Don't know' whether care could have been provided at a GP.
- (d) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities and, in 2010-11 and previous years, very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

Source: ABS unpublished, Patient Experience Survey 2010-11, 2011-12, 2012-13, Cat. no. 4839.0.

- (a) People aged 15 years and over who received a prescription for medication from a GP in the last 12 months and delayed using or did not get medication at any time in the last 12 months due to the cost.
- (b) Data are crude rates and may differ from data in previous reports in which rates were age-standardised.
- (c) Estimates with RSEs between 25 per cent and 50 per cent should be used with caution.
- (d) Data for 2010-11 and subsequent reference years are comparable over time, but are not comparable with data for 2009 due to a change in the sequencing and wording of the survey question. See data quality information at www.pc.gov.au/rogs/2016 for further detail.
- (e) Data are not comparable to data for Aboriginal and Torres Strait Islander people that were sourced from the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey, due to differences in survey design and collection methodology.
- (f) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities, which comprise around 25 per cent of the estimated resident population of the NT.
- (g) For 2013-14 and subsequent years, cells have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

⁽a) Waiting times could not be calculated for some records (including where negative waiting times were reported or where a record had no date of offer or date of dental care).

Median waiting time for public dental care, ACT (days) (a), (b), (c), (d)

ACT Aust (e)

- (b) Some double counting of people may occur across these reference years due to an inability to link people across reference years in this collection.
- (c) The collection excludes people who are treated under jurisdictional priority client schemes.
- (d) Data are not comparable across jurisdictions due to differences in the way in which services are arranged and different arrangements that determine which people requiring treatment are placed on a public dental waiting list, including how jurisdictions prioritise certain disadvantaged population groups. See data quality information available at www.pc.gov.au/rogs/2016 for more detail.
- (e) The calculation of an Australian total is not appropriate given that jurisdictions are not comparable. See data quality information for more detail.
- (f) SEIFA and remoteness are based on the usual residence of the person, not the location of the service provider. Data exclude records for which a SEIFA quintile or remoteness could not be assigned.

FSE = Full Service Equivalent. 1 FSE is approximately equivalent to a 37.5 hour working week.

- (a) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification.
- (b) GP numbers are based on doctors' major practice postcodes as at the last quarter of the reference period. The major practice postcode is the location at which a doctor rendered the most services. FSE numbers are based on doctors' practice location postcodes at which services were rendered within the reference period.
- (c) Historical data have been revised and may differ from previous reports. This is due to a change in methodology used to compute the number of GPs (associated with a small reduction in historical data for the number of GPs) and use of a new proxy measure for hours worked (FSE) in place of the previously used 'Full time Workload Equivalents' (FWE).
- (d) Full Service Equivalent (FSE) is an estimated measure of medical workforce based on Medicare claims information. FSE models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.

⁽b) Includes practices registered for accreditation but not yet accredited, in addition to accredited practices.

Table 10A.55 General practices that are accredited at 30 June (a)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

(c) Data for the total number of practices are not available for 2012 or subsequent years. Historical data were collected by the Primary Health Care Research and Information Service (PHC RIS) for the Annual Survey of Divisions (ASD), in response to the question "How many general practices were in your Division's catchment area at 30 June". Data were provided by all Divisions of General Practice as required under contractual agreements with Department of Health. The ASD ceased with the transition from Divisions of General Practice to Medicare Locals and no other data source has been identified.

na Not available.

⁽a) A SWPE is an indicator of practice workload based on the number of patients seen. The SWPE value for a jurisdiction is the sum of the fractions of care provided by doctors in that jurisdiction to their patients, weighted for the age and sex of each patient in accordance with national ratios.

⁽b) Services may vary in type and quality.

⁽a) The oral antibiotics used most commonly in treating upper respiratory tract infection are: phenoxymethylpenicillin (penicillin V); amoxycillin; erythromycin; roxithromycin; cefaclor; amoxycillin+clavulanic acid; doxycycline; clarithromycin; and cefuroxime. All active PBS item codes associated with each of these generic names were extracted for each year.

Source: Department of Health unpublished, PBS Statistics.

⁽b) These antibiotics are also used for treatment of diseases other than upper respiratory tract infection. The reason for the antibiotic prescription is not known.

⁽c) Data include filled prescriptions ordered by vocationally registered GPs and other medical practitioners (OMPs).

⁽d) A DHS reconciliation process may result in some variance in data for 2014-15.

⁽e) Estimated resident population at 31 December based on the ABS 2011 Census, first preliminary estimates.

Table 10A.61 Uptake by Practices in the Practice Incentives Program (PIP) of the PIP Diabetes Incentive (a), (b)

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|---------------------------------|---------|-------|-------|-------|-------|-------|------|------|------|--------|
| PIP practices (May 2014) | no. | 1 812 | 1 255 | 1 077 | 452 | 367 | 121 | 71 | 55 | 5 210 |
| SWPE (c) | ('000') | 5 259 | 4 346 | 3 383 | 1 701 | 1 301 | 401 | 284 | 101 | 16 774 |
| PIP Diabetes Incentive — uptake | no. | 880 | 528 | 585 | 216 | 130 | 44 | 41 | 40 | 2 464 |
| Share of PIP practices | % | 48.6 | 42.1 | 54.3 | 47.8 | 35.4 | 36.4 | 57.7 | 72.7 | 47.3 |
| PIP practices (May 2015) | no. | 1 824 | 1 282 | 1 118 | 482 | 368 | 127 | 71 | 58 | 5 330 |
| SWPE (c) | ('000') | 5 371 | 4 427 | 3 481 | 1 742 | 1 323 | 407 | 288 | 108 | 17 146 |
| PIP Diabetes Incentive — uptake | no. | 971 | 586 | 651 | 251 | 143 | 53 | 43 | 46 | 2 744 |
| Share of PIP practices | % | 53.2 | 45.7 | 58.2 | 52.1 | 38.9 | 41.7 | 60.6 | 79.3 | 51.5 |

⁽a) Not all practices are involved in PIP, and the proportion may vary across jurisdictions. Around 85 per cent of patient care is provided by practices enrolled in the PIP (table 10A.56).

⁽b) In accordance with the purpose of the PIP Diabetes incentive to encourage general practices to provide earlier diagnosis and effective management of people with established diabetes mellitus, practices are required to maintain an active patient register and recall and reminder system for all known patients with diabetes mellitus, and to agree to implement a cycle of care for patients with diabetes mellitus.

⁽c) A SWPE is an indicator of practice workload based on the number of patients seen. The SWPE value for a jurisdiction is the sum of the fractions of care provided by doctors in that jurisdiction to their patients, weighted for the age and sex of each patient in accordance with national ratios.

Table 10A.62 Proportion of people with known diabetes who had a HbA1c test in the last 12 months, 2011-12 (per cent) (a), (b), (c), (d)

Estimates with RSEs between 25 percent and 50 percent should be used with caution.

- (a) Persons aged 18 years to 69 years. Includes pregnant women.
- (b) Known diabetes is derived using a combination of fasting plasma glucose test results and self-reported information on diabetes diagnosis and medication use. See data quality information for further detail.
- (c) Excludes people who did not fast for 8 hours or more prior to the blood test. For Australia in 2011-12, approximately 79% of people aged 18 years and over who participated in the National Health Measures Survey (NHMS) had fasted.
- (d) Rates are not age standardised.
- (e) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
 - Nil or rounded to zero.

Source: ABS unpublished, Australian Health Survey 2011-13 (2011-12 NHMS component).

Table 10A.64 Proportion of people with asthma with a written asthma action plan, by age (per cent) (a)

Unit NSW Vic Qld WA SA Tas ACT NT (b),(c) Aust (b)

- (a) Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use and are not published. However, these data contribute to national estimates.
- (b) Data for the NT for 2011-12 are not comparable to data for previous years due to an increased sample size. Data for the NT are included in Australian totals but not published for 2001 or 2004-05 and published only for all ages for 2007-08, as sample sizes were insufficient to provide reliable estimates.
- (c) Data for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (d) For 'all ages', 2007-08 and 2011-12 data are age standardised to the 2001 Australian standard population.

- (a) Persons who have been told by a doctor they have asthma, and the asthma is current and long-term.
- (b) Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.
- (c) Excludes remote and very remote areas. Data on whether the respondent has a written asthma action plan was collected for non-remote respondents only in the National Aboriginal and Torres Strait Islander Health Survey.
- (d) Data for Aboriginal and Torres Strait Islander people and for non-Indigenous people use different survey questions to define asthma as current. However, data are comparable.
- (e) Rates are age standardised to the 2001 Australian standard population.
- (f) Data for the NT should be interpreted with caution as the Australian Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

RSE = relative standard error.

- (a) Persons who have been told by a doctor they have asthma, and the asthma is current and long-term.
- (b) Estimates with RSEs between 25 per cent and 50 per cent should be used with caution.
- (c) Rates are age standardised to the 2001 Australian standard population.
- (d) Data for non-Indigenous people for the NT should be interpreted with caution as the Australian Health Survey and National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

RSE = relative standard error.

⁽a) Persons who have been told by a doctor they have asthma, and the asthma is current and long-term.

⁽b) Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use and are not published.

⁽c) Rates are age standardised to the 2001 Australian standard population.

Table 10A.67

Proportion of people with asthma with a written asthma plan, by region, 2007-08 (a), (b), (c), (d)

Unit NSW Vic Qld WA SA Tas ACT NT (e) Aust

- (d) Regions are defined using the Australian Standard Geographical Classification (AGSC), based on the ABS 2006 Census of population and housing. The accuracy of the classifications decreases over time due to changes in demographics within postcode boundaries in the intercensal periods. Not all remoteness areas are represented in each state or territory. There were: no major cities in Tasmania; no outer regional, remote or very remote areas in the ACT; no major cities or inner regional areas in the NT.
- (e) Data for non-Indigenous people for the NT should be interpreted with caution as the National Health Survey excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (f) Very remote data were not collected in the 2007-08 National Health Survey.

⁽a) The chronic disease management (CDM) items include GP only care plans, multidisciplinary care plans (A15 subgroup 1) and case conferences (A15 subgroup 2, excluding items relating to consultant physicians and psychiatrists). Services that qualify under the DVA National Treatment Account or are provided in public hospitals are not included.

Source: Department of Health unpublished, MBS Statistics.

⁽b) Additional chronic disease management MBS items are introduced from time-to-time and may impact on GP use of care planning or case conferencing MBS items.

⁽c) GPs are defined as those General Practitioners and Other Medical Practitioners who have claimed at least 1500 non-referred attendances in the relevant financial year. GPs are counted only in the state/territory where they claimed the most services — this prevents double counting.

ASR = age standardised rate.

- (a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.
- (b) Data are directly age standardised to the 2001 Australian standard population. Data are not comparable to previous years for which crude rates are reported (see table 10A.70).
- (c) GPs are defined as vocationally registered GPs and other medical practitioners (OMPs).
- (d) Includes Department of Veterans' Affairs (DVA) data.
- (e) In general, Medicare benefits are payable for a maximum of three MBS pathology items per specimen (generally, the three most expensive items). Data do not include additional tests that are performed but not rebated.
- (f) Includes Patient Episode Initiated (PEI) Items. From 1 November 2009 benefits for PEI Items were reduced and bulk billing incentives for PEI Items commenced. This contributed to a change in the mix and amount of benefits for tests ordered by GPs and OMPs.
- (g) Estimated resident populations used to derive rates are first preliminary estimates based on the 2011 Census.
- (h) Data for 2012-13 exclude tests ordered by eligible midwives and nurse practitioners. Data for 2013-14 include tests ordered by eligible nurse practitioners.

Table 10A.70 Pathology tests requested by GPs, real benefits paid, 2010-11 to 2011-12 (2014-15 dollars) and number of rebated MBS pathology items (a), (b), (c), (d), (e), (f), (g), (h)

- (d) Includes Department of Veterans' Affairs (DVA) data.
- (e) Estimated resident populations used to derive rates are first preliminary estimates based on the 2011 Census.
- (f) Data for 2012-13 exclude tests ordered by eligible midwives and nurse practitioners. Data for 2013-14 include tests ordered by eligible nurse practitioners.

Table 10A.72 Diagnostic imaging referred by GPs and rebated through Medicare, real benefits paid, 2010-11 to 2011-12 (2014-15 dollars) and number of rebated MBS imaging items (a), (b), (c), (d), (e), (f), (g)

⁽a) Time series financial data are adjusted to 2014-15 dollars using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) (table 10A.110). See chapter 2 (sections 2.5-6) for details.

- (c) GPs are defined as vocationally registered GPs and other medical practitioners (OMPs).
- (d) Includes Department of Veterans' Affairs (DVA) data.
- (e) From 2011-12, DVA data exclude tests ordered by local medical officers who are not specialist GPs. DVA data for previous years include all data for tests ordered by all local medical officers, including but not limited to specialist GPs.
- (f) Data for 2012-13 exclude tests ordered by eligible midwives and nurse practitioners. Data for 2013-14 include tests ordered by eligible nurse practitioners.
- (g) Population data used to derive rates are revised to the ABS' final 2011 Census rebased estimates. See chapter 2 (table 2A.2) for details.

⁽b) Per person data for 2011-12 and previous years are crude rates and are not comparable to data for 2012-13 and subsequent years which are age standardised (see table 10A.71).

- (a) Proportion of PIP practices registered for the PIP eHealth Incentive. Not all practices are involved in PIP, and the proportion may vary across jurisdictions. Around 85 per cent of patient care is provided by practices enrolled in the PIP (table 10A.56).
- (b) In accordance with the purpose of the PIP eHealth incentive to encourage general practices to keep up-to-date with the latest developments in eHealth, new eligibility requirements were introduced from 1 February 2013, requiring practices to: integrate healthcare identifiers into electronic practice records; have a secure messaging capability; use data records and clinical coding of diagnoses; send prescriptions electronically to a prescription exchange service; and, participate in the eHealth record system and be capable of creating and uploading Shared Health Summaries and Event Summaries using compliant software. A number of practices took time to meet these requirements, as reflected in the sharp decrease in the share of PIP practices registered as having taken up the eHealth incentive in May 2013 and the recovery in subsequent years.
 - Under the previous requirements, practices were required to: have a secure messaging capability provided by an eligible supplier; have (or have applied for) a location/site Public Key Infrastructure (PKI) certificate for the practice and each practice branch, and make sure that each medical practitioner from the practice has (or has applied for) an individual PKI certificate; and, provide practitioners from the practice with access to a range of key electronic clinical resources.
- (c) A SWPE is an indicator of practice workload based on the number of patients seen. The SWPE value for a jurisdiction is the sum of the fractions of care provided by doctors in that jurisdiction to their patients, weighted for the age and sex of each patient in accordance with national ratios.

Table 10A.74 Practices in the Practice Incentives Program (PIP) using computers for clinical purposes, by region (a), (b), (c)

| | Unit | Major cities | Inner regional | Outer regional | Remote | Very remote | Australia |
|---|------|-----------------|-------------------|-------------------|--------|----------------|-----------|
| PIP practices (May 2013) | no. | 3 425 | 981 | 536 | 104 | 71 | 5 117 |
| PIP eHealth Incentive uptake — share of PIP practices | % | 72.3 | 77.5 | 68.8 | 55.8 | 43.7 | 72.2 |
| PIP practices (May 2014) | no. | 3 484 | 1 012 | 546 | 99 | 69 | 5 210 |
| PIP eHealth Incentive uptake — share of PIP practices | % | 86.9 | 88.9 | 82.8 | 72.7 | 62.3 | 86.3 |
| PIP practices (May 2015) | no. | 3 567 | 1 030 | 560 | 106 | 67 | 5 330 |
| PIP eHealth Incentive uptake — share of PIP practices | % | 90.6 | 90.9 | 85.5 | 79.3 | 70.2 | 90.0 |

- (a) Proportion of PIP practices registered for the PIP eHealth Incentive. Not all practices are involved in PIP, and the proportion may vary across jurisdictions. Around 85 per cent of patient care is provided by practices enrolled in the PIP (table 10A.56).
- (b) Remoteness areas are based on the Australian Statistical Geography Standard 2011 (ASGS) classification and are not comparable with data for previous years, which were based on a different classification.
- (c) In accordance with the purpose of the PIP eHealth incentive to encourage general practices to keep upto-date with the latest developments in eHealth, new eligibility requirements were introduced from 1 February 2013, requiring practices to: integrate healthcare identifiers into electronic practice records; have a secure messaging capability; use data records and clinical coding of diagnoses; send prescriptions electronically to a prescription exchange service; and, participate in the eHealth record system and be capable of creating and uploading Shared Health Summaries and Event Summaries using compliant software. A number of practices took time to meet these requirements and this is reflected in a drop in the share of PIP practices registered as having taken up the eHealth incentive in May 2013 compared to historical data under previous requirements (see table 10A.75).
 Previously, practices were required to: have a secure messaging capability provided by an eligible

Previously, practices were required to: have a secure messaging capability provided by an eligible supplier; have (or have applied for) a location/site Public Key Infrastructure (PKI) certificate for the practice and each practice branch, and make sure that each medical practitioner from the practice has (or has applied for) an individual PKI certificate; and, provide practitioners from the practice with access to a range of key electronic clinical resources.

- (a) Remoteness areas are based on the 1994 Rural, Remote and Metropolitan Areas classification. Capital city = State and Territory capital city statistical divisions; other metropolitan centre = one or more statistical subdivisions that have an urban centre with a population of 100 000 or more; large rural centre = SLAs where most of the population resides in urban centres with a population of 25 000 or more; small rural centre = SLAs in rural zones containing urban centres with populations between 10 000 and 24 999; other rural area = all remaining SLAs in the rural zone; remote centre = SLAs in the remote zone containing populations of 5000 or more; other remote area = all remaining SLAs in the remote zone.
- (b) Not all practices are involved in PIP, and the proportion may vary across jurisdictions. Around 85 per cent of patient care is provided by practices enrolled in the PIP (table 10A.56).
- (c) A SWPE is an indicator of practice workload based on the number of patients seen. The SWPE value for a jurisdiction is the sum of the fractions of care provided by doctors in that jurisdiction to their patients, weighted for the age and sex of each patient in accordance with national ratios.
- (d) In accordance with the purpose of the PIP eHealth incentive to encourage general practices to keep up-to-date with the latest developments in eHealth, new eligibility requirements were introduced from 1 February 2013, requiring practices to: integrate healthcare identifiers into electronic practice records; have a secure messaging capability; use data records and clinical coding of diagnoses; send prescriptions electronically to a prescription exchange service; and, participate in the eHealth record system and be capable of creating and uploading Shared Health Summaries and Event Summaries using compliant software. A number of practices took time to meet these requirements and this is reflected in a drop in the share of PIP practices registered as having taken up the eHealth incentive in May 2013 (see tables 10A.73 and 10A.74).
 - Under the previous requirements, practices were required to: have a secure messaging capability provided by an eligible supplier; have (or have applied for) a location/site Public Key Infrastructure (PKI) certificate for the practice and each practice branch, and make sure that each medical practitioner from the practice has (or has applied for) an individual PKI certificate; and, provide practitioners from the practice with access to a range of key electronic clinical resources.

RSE = Relative standard error. **CI** = confidence interval.

- (a) Estimates with a relative standard error (RSE) between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are are considered too unreliable for general use and are marked with '**'.
- (b) Proportion of people 15 years or over who saw a GP in the last 12 months for their own health (excluding interviews by proxy) reporting the GP always or often: listened carefully, showed respect, and spent enough time with them.
- (c) Data are crude rates and may differ from data in previous reports in which rates were age-standardised.
- (d) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities, which comprise around 25 per cent of the estimated resident population of the NT.
- (e) 'Other' includes inner and outer regional, remote and very remote areas.
- (f) For 2013-14 and subsequent years, cells have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
 - .. Not applicable. Nil or rounded to zero. np Not published.

| RSE | % | 1.8 | 2.1 | 2.3 | 1.1 |
| 95% CI | ± % | 3.0 | 3.4 | 3.7 | 1.9 |

RSE = Relative standard error. **95% CI** = confidence interval.

- (a) Persons 15 years and over who saw a GP in the last 12 months for their own health (excluding interviews by proxy), reporting the GP always or usually listened carefully, showed respect, and spent enough time with them.
- (b) Rates are age standardised to the 2001 estimated resident population (5 year ranges).
- (c) Data are not comparable with data for all Australians that were sourced from the ABS 2012-13 Patient Experience Survey, due to differences in survey design and collection methodology.
- (d) Information on how to interpret and use the data appropriately is available from Explanatory Notes in Australian Aboriginal and Torres Strait Islander Health Survey: First Results, 2012-13 (Cat. no. 4727.0.55.001) and the Australian Aboriginal and Torres Strait Islander Health Survey: Users' Guide, 2012-13 (Cat. no. 4727.0.55.002).
- (e) Includes major cities, inner and outer regional areas only, as these survey questions were not asked in remote and very remote areas.

RSE = Relative standard error. **CI** = confidence interval.

- (a) Proportion of people who saw a dental professional for their own health in the last 12 months (excluding interviews by proxy) reporting the dental professional always or often: listened carefully, showed respect, and spent enough time with them.
- (b) Data are crude rates and may differ from data in previous reports in which rates were age-standardised.
- (c) Data for the NT should be interpreted with caution as the Patient Experience Survey excluded discrete Aboriginal and Torres Strait Islander communities, which comprise around 25 per cent of the estimated resident population of the NT.
- (d) 'Other' includes inner and outer regional, remote and very remote areas.
- (e) For 2013-14 and subsequent years, cells have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
 - .. Not applicable. Nil or rounded to zero.

- (a) Coverage measured for all children immunised at the age of 12 months to less than 15 months, by the State or Territory in which the child resided.
- (b) Children assessed as fully immunised at 12 months are immunised against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, *Haemophilus influenzae* type b and, from the quarter ending 31 December 2013, pneumococcal.
- (c) The Australian Childhood Immunisation Register (ACIR) includes all children under 7 years of age who are registered with Medicare. By the age of 12 months, over 98 per cent of Australian children have been registered with Medicare (NCIRS 2000).
- (d) There may be some under-reporting by providers. Therefore, vaccine coverage estimates calculated using ACIR data are considered minimum estimates.
- (e) Reference periods comprise the complete financial year. Data may differ from other reports where a different reference period is used.
- (f) NT immunisation records differ from published ACIR data due to a review of a rule change implemented in 2009. As a result, all reports affected by the change were recalculated accounting for the anomaly.
- (g) Coverage rates were relatively low for the June 2011 quarter, associated with parents not receiving immunisation reminders due to administrative error. This may be reflected in relatively low coverage rates for 2010-11.
- (h) Immunisation against pneumococcal is included for assessment of children as fully immunised at 12 months from the quarter ending 31 December 2013.

Source: Department of Health unpublished, ACIR data collection.

- (a) Coverage measured for children immunised at the age of 24 months to less than 27 months, by the State or Territory in which the child resided.
- (b) Children assessed as fully immunised at 24 months are immunised against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, *Haemophilus influenzae* type b, measles, mumps and rubella and, from the quarter ending 31 December 2014, meningococcal C and varicella (chickenpox).
- (c) The ACIR includes all children under 7 years of age who are registered with Medicare. By the age of 12 months, over 98 per cent of Australian children have been registered with Medicare (NCIRS 2000).
- (d) There may be some under-reporting by providers. Therefore, vaccine coverage estimates calculated using ACIR data are considered minimum estimates.
- (e) Reference periods comprise the complete financial year. Data may differ from other reports where a different reference period is used.
- (f) NT immunisation records differ from published ACIR data due to a review of a rule change implemented in 2009. As a result, all reports affected by the change were recalculated accounting for the anomaly.
- (g) A decrease in the proportion of children who were fully immunised from 2013-14 to 2014-15 is associated with the introduction of additional vaccines in the definition of fully immunised.

Source: Department of Health unpublished, ACIR data collection.

⁽a) Notification of the relevant State/Territory authority is required when measles is diagnosed. Available diagnostic tools make it uncommon for cases to go undiagnosed and therefore the 'notified fraction' for measles — the proportion of total cases for which notification is made — is expected to be high, with little variation between states and territories as well as over time.

⁽b) Cases defined based on Communicable Diseases Network Australia (CDNA) National Notifiable Diseases Surveillance System (NNDSS) case definitions.

⁽c) Data are suppressed for number of notifications where number is less than 3 and for rates where numerator is less than 5.

⁽a) Notification of the relevant State/Territory authority is required when whooping cough is diagnosed. Diagnosis cannot always be confirmed using available tools. Therefore, the 'notified fraction' is likely to be only a proportion of the total number of cases. The notified fraction may vary between states and territories and over time.

⁽b) Cases defined based on Communicable Diseases Network Australia (CDNA) National Notifiable Diseases Surveillance System (NNDSS) case definitions.

Table 10A.86 Notifications of pertussis (whooping cough), children aged 0–14 years (a), (b), (c), (d), (e)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

- (c) Epidemics of pertussis in Australia historically occur at regular intervals of approximately 4 years on a background of endemic circulation, resulting in large fluctuations in notification numbers over time. The large variations in pertussis notifications in states and territories during this reporting period are mainly due to a nationwide epidemic that commenced in 2008 and peaked in 2011. The timing of each jurisdiction's peak whooping cough activity varied during this time. NSW and Victoria are currently experiencing increased levels of pertussis activity which began during 2014.
- (d) Data are suppressed for number of notifications where number is less than 3 and for rates where numerator is less than 5.
- (e) Reference periods comprise the complete financial year. Data may differ from other reports that use a different reference period.
- (f) Rates are derived using the ERP as at December 31. Rates have been revised to the ABS' final 2011 Census rebased ERP and may differ from previous reports. See chapter 2 (table 2A.2) for details.

ASR = age standardised rate.

- (a) The participation rate is the number of women screened during the reference period as a percentage of the eligible female population, calculated as the average of the Australian Bureau of Statistics (ABS) ERP in each of the calendar years in the reference period. Reference periods are from 1 January at commencement to 31 December at end of the 24 month period.
- (b) Participation rates for women 40 years or over and the target age group are age standardised to the 2001 Australian population standard.
- (c) Data include only women who were residents of the jurisdiction in which they were screened. Data may differ from participation rates data published elsewhere that allocate women to jurisdictions based on the jurisdiction in which screening took place.
- (d) Residents of Victorian postcodes allocated to the Albury/Wodonga catchment (NSW jurisdiction) are included in Victoria's population estimate, accounting for the slight decrease in participation rates compared to those published by BreastScreen Victoria.
- (e) The fall in the participation rate for SA in 2012–2013 reflects a temporary reduction in the total number of women screened, instigated to best manage a Digital Mammography System Wide Review and implementation of the review recommendations, concurrent with the introduction of a new client information system. Going forward, BreastScreen SA anticipates a return to forecasted participation rates.

Table 10A.88 Participation rates for women in BreastScreen Australia (24 month period) (a), (b), (c)

NSW Vic (d) Qld WA SA (e) Tas ACT (f) NT Aust (g)

- (f) In general, 99 per cent or more of women screened are residents of the jurisdiction in which screening took place. In the ACT, 2.0 per cent of women screened in the 24 months 2013–2014 were not ACT residents, a decline from 7–9 per cent of women screened in previous 24 month periods. The decline reflects a change in arrangements between the ACT and NSW, whereby from November 2013 a limited number of ACT screening appointments are available for NSW residents who work in the ACT. Previously, the ACT provided screening services to residents in some southern parts of NSW.
- (g) Data for Australia include women screened in a jurisdiction other than their jurisdiction of residence.

ASR = age standardised rate.

- (a) Rates are derived using populations that are revised to the ABS 2011 Census rebased population estimates and projections and may differ from previous reports.
- (b) The participation rate is the number of women resident in the catchment area screened in the reference period, divided by the number of women resident in the catchment area in the reference period based on Australian Bureau of Statistics (ABS) ERP data. Where service boundaries cross State localised areas, calculation of resident women is made on a proportional basis. If a woman is screened more than once during the reference period then only the first screen is counted. Catchment area: a geographic region based on service size in relation to the population, accessibility and the location of other services. It is uniquely defined for each service based on postcode or Statistical Local Area (SLA). Reference periods are from 1 January at commencement to 31 December at end of the 24 month period.
- (c) Aboriginal and/or Torres Strait Islander women are women who self-identified as being of Aboriginal and/or Torres Strait Islander descent.
- (d) Residents of Victorian postcodes allocated to the Albury/Wodonga catchment (NSW jurisdiction) are included in Victoria's population estimate, accounting for the slight decrease in participation rates compared to those published by BreastScreen Victoria.
- (e) Data for WA may include some Aboriginal and/or Torres Strait Islander women usually resident in the NT in in WA catchment areas.
- (f) In general, 99 per cent or more of women screened are residents of the jurisdiction in which screening took place. In the ACT, 2.0 per cent of women screened in the 24 months 2013–2014 were not ACT residents, a decline from 7–9 per cent of women screened in previous 24 month periods. The decline reflects a change in arrangements between the ACT and NSW, whereby from November 2013 a limited number of ACT screening appointments are available for NSW residents who work in the ACT. Previously, the ACT provided screening services to residents in some southern parts of NSW.

Table 10A.91 Participation rates for NESB women screened by BreastScreen Australia (24 month period) (first and subsequent rounds) (per cent) (a), (b), (c)

NSW Vic (d) Qld WA SA Tas (e) ACT (f) NT Aust

ASR = age standardised rate. **NESB** = Non English speaking background.

- (a) The participation rate is the number of NESB women residents in the catchment area screened in the reference period, divided by the estimated number of NESB women resident in the catchment area in that period. The female NESB population estimate is derived by applying the NESB age distribution from the 2011 Census to the Australian Bureau of Statistics (ABS) female ERP data for the relevant year. Where service boundaries cross State localised areas, calculation of resident women is made on a proportional basis. If a woman is screened more than once during the reference period then only the first screen is counted. Catchment area: a geographic region based on service size in relation to the population, accessibility and the location of other services. It is uniquely defined for each service based on postcode or Statistical Local Area (SLA). Reference periods are from 1 January at commencement to 31 December at end of the 24 month period.
- (b) Estimated Resident Populations (ERPs) to June 2011 used to derive rates are revised to the ABS' final 2011 Census rebased ERPs and rates may differ from those published in previous reports. The final ERP replaces the preliminary 2006 Census based ERPs used in the 2013 Report. ERP data from June 2012 are first preliminary estimates based on the 2011 Census. See Chapter 2 (table 2A.1) for details.
- (c) NESB is defined as persons who speak a language other than English at home.
- (d) Residents of Victorian postcodes allocated to the Albury/Wodonga catchment (NSW jurisdiction) are included in Victoria's population estimate, accounting for the slight decrease in participation rates compared to those published by BreastScreen Victoria.
- (e) An apparent drop in participation of NESB women in Tasmania occurred from the 2005–2006 screening period and coincided with a significant reduction in self-reporting of NESB status that followed a change in the client registration form in 2006. Since revision of the form in May 2009, both self-reporting of NESB status and participation rates are returning to earlier levels. The observed drop in participation, therefore, appears to reflect the drop in self reporting of NESB status rather than reduced participation.
- (f) In general, 99 per cent or more of women screened are residents of the jurisdiction in which screening took place. In the ACT, 2.0 per cent of women screened in the 24 months 2013–2014 were not ACT residents, a decline from 7–9 per cent of women screened in previous 24 month periods. The decline reflects a change in arrangements between the ACT and NSW, whereby from November 2013 a limited number of ACT screening appointments are available for NSW residents who work in the ACT. Previously, the ACT provided screening services to residents in some southern parts of NSW.

ASR = age standardised rate.

- (a) Rates are the number of women screened as a proportion of the eligible female population, calculated as the average of the Australian Bureau of Statistics (ABS) estimated resident population (ERP) in each of the calendar years in the reference period. Rates for '40+ years' and '50–69 years' are age standardised to the Australian population at 30 June 2001.
- (b) Periods are from 1 January at commencement to 31 December at end of the 24 month period.
- (c) Data are suppressed where numerator is less than 5 or denominator is less than 1000.
- (d) Remoteness areas are defined using the Australian Standard Geographical Classification (AGSC), based on the ABS Census of population and housing for 2006. The accuracy of remoteness classifications decreases over time since the census year due to demographic changes within postcode boundaries. Sources of inaccuracy particularly affect rates based on small numbers and these should be interpreted with caution. Areas where rates are based on small numbers include very remote areas in NSW, SA and Tasmania, remote areas in Victoria and Tasmania, and inner regional areas in the ACT. Minor differences can result in apparently large variations where numerators are small numbers.
- (e) Women were allocated to a remoteness area based on postcode of usual residence. Some women's postcodes could not be matched to a remoteness area; these women were excluded from the state and territory calculations, but included in the state and territory and Australia totals. Some postcodes supplied by women may not accurately reflect their usual residence.
- (f) Data are not available for the 24 month periods 2007 and 2008, and 2011 and 2012. Data are not available for states and territories for the 24 month periods from 2010 and 2011.
- (g) In general, 99 per cent or more of women screened are residents of the jurisdiction in which screening took place. In the ACT, around 7–9 per cent of women screened in each 24 month period were not ACT residents. The ACT provided screening services to residents in some southern parts of NSW until November 2013.

ASR = age standardised rate.

- (a) Rates are the number of women screened as a proportion of the eligible female population calculated as the average of the Australian Bureau of Statistics estimated resident population based on the 2011 Census in each of the calendar years in the reference period. Age-standardised rates are standardised to the 2001 Australian standard population.
- (b) The eligible female population has been adjusted for the estimated proportion of women who have had a hysterectomy, using age-specific hysterectomy fractions derived from the AIHW National Hospitals Morbidity Database. Historical data may differ from data in previous reports for which hysterectomy fractions were estimated using a different methodology.
- (c) Data exclude women who have opted off the cervical cytology register.
- (d) Reference periods are from 1 January at commencement to 31 December at end of the 24 month period.
- (e) Number of women screened includes all women screened in each jurisdiction (not just those women resident in each jurisdiction) with the exception of: Victoria, for the reference periods 2005–2006 and 2007–2008, where only residents of the jurisdiction are included; the ACT, where only residents of the jurisdiction (and in some cases some immediate border residents) are included. Data may differ from data published elsewhere in which allocation of women to jurisdictions is by residential postcode.

Table 10A.96 Proportion of adults 65 years or over fully vaccinated against influenza and pneumococcal disease, by remoteness, 2009 (a), (b), (c), (d)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

RSE = Relative standard error.

- (a) Estimates are for people aged 65 years or over who are fully vaccinated against both influenza and pneumococcal disease. To be 'fully vaccinated' against pneumococcal disease requires a follow-up vaccination up to 5 years after the initial vaccination. This contributes to potential error in the estimates. Influenza vaccinations have been available free to older adults since 1999 while vaccinations against pneumococcal disease became available free in 2005.
- (b) Remoteness areas are defined using the Australian Standard Geographical Classification (AGSC), based on the ABS 2006 Census of population and housing. Not all remoteness areas are represented in each state or territory. There were: no major cities in Tasmania; no outer regional, remote or very remote areas in the ACT; no major cities or inner regional areas in the NT.
- (c) Rates are age-standardised to the 2001 Australian standard population.
- (d) Estimates with relative standard errors (RSEs) between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use and are not published.
- (e) Remote and very remote categories have been aggregated due to small numbers.
- (f) Total includes people for whom a remoteness category could not be assigned as the place of residence was unknown or not stated.
 - .. Not applicable. np Not published.

- (a) Rates are age-standardised to the 2001 Australian standard population.
- (b) Data quality information (DQI) for some data in this table is at www.pc.gov.au/rogs/2016.
- (c) Separation rates are based on state or territory of usual residence, not state or territory of hospitalisation. Separations for patients usually resident overseas are excluded. Totals include Australian residents of external Territories.
- (d) Caution should be used in comparing data over time as there have been changes between the International Statistical Classification of Diseases and Related Health Problems, Australian Modification (ICD-10-AM) editions and the associated Australian Coding Standards. See DQI for more information.
- (e) Data for Tasmania are not comparable over time as 2008-09 data exclude two private hospitals that account for approximately one eighth of Tasmania's total hospital separations, while data for subsequent reference years include these hospitals.
- (f) Changes to the coding standard for Viral hepatitis in the 8th edition of ICD-10-AM may account for a proportion of the increase in the rate of vaccine preventable conditions. See Appendix A of AIHW 2015 Admitted patient care 2013–14: Australian hospital statistics for more details.
- (g) More than one category may be reported during the same hospitalisation. Therefore, the total is not necessarily equal to the sum of the components.

Source: AIHW unpublished, National Hospital Morbidity Database; ABS unpublished, Estimated Resident Population, 30 June preceding the reference period.

⁽a) Rates are age-standardised to the 2001 Australian standard population.

⁽b) Data quality information (DQI) for some data in this table is at www.pc.gov.au/rogs/2016.

⁽c) Cells have been suppressed to protect confidentiality where a patient or service provider could be identified.

⁽d) Cell sizes are small for some categories and rates may be statistically volatile.

⁽e) Separation rates are based on state or territory of usual residence, not state or territory of hospitalisation. Separations for patients usually resident overseas are excluded. Totals include Australian residents of external Territories.

⁽f) Caution should be used in comparing data over time as there have been changes between the International Statistical Classification of Diseases and Related Health Problems, Australian Modification (ICD-10-AM) editions and the associated Australian Coding Standards. See DQI for more information.

⁽g) Data for Tasmania and the ACT should be interpreted with caution until further assessment of Indigenous identification is completed. For 2010-11 and subsequent years, Indigenous status data for Tasmania and the ACT are of sufficient quality for statistical reporting purposes. For 2009-10 and previous years, data for Tasmania and the ACT were not included in national totals and should be interpreted with particular caution.

Table 10A.99

Separations for selected potentially preventable hospitalisations by Indigenous status (per 1000 people) (a), (b), (c), (d), (e), (f)

NSW Vic *SA Tas* (g), (h) ACT (g) Qld WA NT Aust (e)

- (h) Data for Tasmania are not comparable over time as 2008-09 data exclude two private hospitals that account for approximately one eighth of Tasmania's total hospital separations, while data for subsequent reference years include these hospitals.
- Changes to the coding standard for Viral hepatitis in the 8th edition of ICD-10-AM may account for a proportion of the increase in the rate of vaccine preventable conditions. See Appendix A of AIHW 2015 Admitted patient care 2013–14: Australian hospital statistics for more details.
- Other Australians includes separations where Indigenous status was not stated.
- (k) More than one category may be reported during the same hospitalisation. Therefore, the total is not necessarily equal to the sum of the components.

Separations for selected potentially preventable hospitalisations by remoteness, 2013-14 (per 1000 people) (a), (b), (c), (d), (e), (f), (g)

NSW Vic Qld WA SA Tas ACT NT Aust (e)

- (a) Rates are age-standardised to the 2001 Australian standard population.
- (b) Remoteness areas are defined using the ABS 2011 Census based Australian Standard Geographical Classification (ASGS). Not all remoteness areas are represented in each state or territory. Caution should be used in comparing 2012-13 data with earlier years in which remoteness areas were defined using a different geographical classification. See data quality information (DQI) at www.pc.gov.au/rogs/2016 for further detail.
- (c) There are: no major cities in Tasmania; no outer regional, remote or very remote areas in the ACT; no major cities or inner regional areas in the NT.
- (d) Cells have been suppressed to protect confidentiality where a patient or service provider could be identified.
- (e) Cell sizes are small for some categories and rates may be statistically volatile.
- (f) Separation rates are based on state or territory and remoteness area of usual residence, not hospitalisation. Separations for patients usually resident overseas are excluded. Totals include Australian residents of external Territories.
- (g) Caution should be used in comparing data over time as there have been changes between the International Statistical Classification of Diseases and Related Health Problems, Australian Modification (ICD-10-AM) editions and the associated Australian Coding Standards. See DQI for more information.
- (h) More than one category may be reported during the same hospitalisation. Therefore, the total is not necessarily equal to the sum of the components.
 - .. Not applicable. np Not published.

PRIMARY AND COMMUNITY HEALTH PAGE 1 of TABLE 10A.104

Table 10A.104 Separations for selected chronic conditions by Indigenous status, 2013-14 (per 1000 people) (a), (b), (c), (d), (e), (f), (g)

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust (h) |
|-----------------------------|------|------|------|-----|------|------|-----|------|----------|
| Rheumatic heart disease (j) | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | _ | 0.1 | 0.1 | 0.1 |
| Bronchiectasis | 0.2 | 0.2 | 0.3 | 0.2 | 0.1 | 0.2 | 0.1 | 0.2 | 0.2 |
| Total (i), (k), (l) | 10.2 | 11.1 | 12.0 | 9.9 | 11.2 | 10.6 | 7.9 | 10.9 | 10.8 |

- (a) Conditions are defined by ICD-10-AM codes that are available on request.
- (b) Excludes separations with a care type of Newborn without qualified days, and records for Hospital boarders and Posthumous organ procurement.
- (c) Separation rates are directly age standardised to the 2001 Australian standard population.
- (d) Separation rates are based on state or territory of usual residence.
- (e) Rates are derived using population estimates and projections based on the 2011 Census.
- (f) Indigenous status data for all states and territories are of sufficient quality for statistical reporting purposes for 2011-12 and subsequent reporting years.
- (g) Cell sizes are small for some categories and rates may be statistically volatile.
- (h) Data for Australia include all States and Territories and Australian residents of external Territories.
- (i) Excludes separations with an additional diagnosis of diabetes complications.
- (j) Rheumatic heart disease includes acute rheumatic fever as well as the chronic disease.
- (k) Total may not sum to the individual categories as more than one chronic condition can be reported for a separation.
- (I) Data for non-Indigenous Australians include separations where Indigenous status was not stated.
 - Nil or rounded to zero.

Table 10A.105 Ratio of separations for Aboriginal and Torres Strait Islander people to all Australians, diabetes, 2013-14 (a), (b), (c), (d), (e), (f)

| | Unit | NSW | Vic | Qld | WA | SA | Tas (b) | ACT (b) | NT (b) | Aust |

| All diabetes — excluding | | | | | | | | | | |
| diabetes complications as | no. | 4 421 | 876 | 5 300 | 3 790 | 1 354 | 236 | 124 | 2 556 | 18 657 |
| an additional diagnosis (h) | SHSR | 2.06 | 1.73 | 2.65 | 3.64 | 2.73 | 1.08 | 3.03 | 2.99 | 2.50 |
| All diabetes (i) | no. | 8 749 | 1 891 | 14 568 | 14 463 | 2 769 | 466 | 235 | 8 908 | 52 049 |
| | SHSR | 2.39 | 2.10 | 3.85 | 8.38 | 3.35 | 1.17 | 2.90 | 5.90 | 3.97 |

SHSR = Standardised Hospital Separation Ratio

- (a) Excludes separations with a care type of Newborn without qualified days, and records for Hospital boarders and Posthumous organ procurement.
- (b) Data are available for Tasmania and the ACT for the first time. NT data are for public hospitals only.
- (c) Caution should be used in the interpretation of these data because of jurisdictional differences in data quality.
- (d) Ratios are directly age standardised to the 2001 Australian standard population.
- (e) Separation rates are based on state of usual residence.
- (f) Changes to the Australian Coding Standards between ICD-10-AM editions have resulted in fluctuations in the reporting of diagnoses for diabetes over time. Therefore caution should be used in comparisons of these data with earlier periods.
- (g) Includes ICD-10-AM codes of Principal diagnosis in: 'E10', 'E11', 'E13', 'E14' or O24'.
- (h) Includes ICD-10-AM codes of Principal diagnosis in: 'E10', 'E11', 'E13', 'E14' or 'O24' or Additional diagnosis in 'E109', 'E119', 'E139' or 'E149'.
- (i) All diabetes refers to separations with either a principal or additional diagnosis of diabetes. Includes ICD-10-AM codes in: 'E10', 'E11', 'E13', 'E14' or O24'.

Table 10A.106 Separations for Type 2 diabetes mellitus as principal diagnosis by complication, all hospitals, 2013-14 (per 100 000 people) (a), (b), (c), (d), (e), (f), (g)

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust (f) |
|------------------|------|------|-------|-------|-------|-----|-----|----|----------|
| Circulatory | 14.5 | 11.4 | 9.7 | 25.9 | 10.8 | np | np | np | 13.5 |
| Renal | 3.5 | 2.0 | 3.1 | 3.4 | 3.8 | np | np | np | 3.1 |

| Total (h) | 87.4 | 97.1 | 112.4 | 132.1 | 122.0 | np | np | np | 104.2 |

- (a) Rates are age standardised to the 2001 Australian standard population.
- (b) Excludes separations with a care type of Newborn without qualified days, and records for hospital boarders and posthumous organ procurement.
- (c) Results for individual complications may be affected by small numbers, and need to be interpreted with care.
- (d) Differences across jurisdictions in policy and practice relating to the admission of patients, the availability of outpatient services and the incentives to admit patients rather than treat them as outpatients will affect estimates of hospital separations.
- (e) Morbidity data are coded under coding standards that may differ over time and across jurisdictions.
- (f) Data for Tasmania, the ACT and the NT are not published separately (due to private hospital confidentiality arrangements) but are included in the total for Australia.
- (g) Changes to the Australian Coding Standards between ICD-10-AM editions have resulted in fluctuations in the reporting of diagnoses for diabetes over time. Therefore caution should be used in comparisons of these data with earlier periods.
- (h) Totals may not add as a result of rounding.

np Not published.

Table 10A.107 Proportion of separations for principal diagnosis of Type 2 diabetes mellitus that were same day by complication, all hospitals, 2013-14 (per cent) (a), (b), (c), (d), (e), (f), (g)

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust (f) |

| Program | Description | Budgetary context | Reporting |
|---|--|--|---|
| Blood-borne Viruses (BBV) and Sexually Transmissible Infection (STI) Prevention and Control | The BBV and STI Prevention and Control Program (the Program) provides funding to support the implementation of Commonwealth commitments to national efforts to reduce the prevalence and burden of BBV and STI on Australian communities and affected populations. The Commonwealth Government works with partners including state and territory governments, research institutions and community-based organisations to prevent exposure to and transmission of blood-borne viruses (BBV) and sexually transmissible infections (STI), as well as, improve the health outcomes of people living with or at risk of these diseases. Funding under this Programme is provided to address hepatitis B, hepatitis C, HIV/AIDS, chlamydia, gonorrhoea, syphilis and trichomonas, and the priority populations to be targeted include: • Aboriginal and Torres Strait Islander people, • young people aged 30 years and under, • gay men and men who have sex with men, • culturally and linguistically diverse people, • people who inject drugs, and • sex workers. | State and Commonwealth Co-funded and coordinated at the national level to achieve program objectives and targets | Routine reporting – quarterly – progress and annual reports |

| Program | Description | Budgetary context | Reporting |
| Quality Use of Medicines Programmes | The Australian Government supports the National Medicines Policy, a key objective of which is Quality Use of Medicines (QUM). QUM services improve health outcomes and the ongoing sustainability of the Pharmaceutical Benefits Scheme (PBS). NPS MedicineWise is the Government's QUM implementation arm, providing education and awareness programmes for specialists, general practitioners, pharmacists and consumers. Current key focus areas include the Choosing Wisely Australia initiative which supports health professionals and consumers to reduce inappropriate care by choosing medical treatments and procedures judiciously. NPS MedicineWise also supports the Medicare Benefits Scheme (MBS) through education programmes to improve the quality use of diagnostics and pathology services. | Commonwealth Department of Health \$47.6 million (2014-15) | Annual Report and the Portfolio Budget Statements (under Program 7.4: Research Capacity & Quality Regular service activity and financial reports are provided to the Department of Health in line with an agreed reporting framework. |
| Royal Flying Doctor Service | The Australian Government funds the Royal Flying Doctor Service of Australia (RFDS) to provide essential primary health care service 'traditional services', that is emergency primary aeromedical evacuations, primary GP and nursing health clinics, remote consultations and medical chests in remote and very remote areas which are beyond the normal medical infrastructure in areas of market failure. | Commonwealth Department of Health | Reporting is quarterly for health, financial data and qualitative information. |
| | The Rural Women's GP Service (RWGPS) aims to improve access to primary health care services for women in rural and remote Australia, who currently have little or no access to a female GP, by facilitating the travel of female GPs to these communities. | Commonwealth Department of Health to the Royal Flying Doctor Service to deliver the RWGPS. | Reporting quarterly by exception. Six monthly for full health, financial data and qualitative reporting. |

Table 10A.111 Australian Government, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--|--|--|--|
| Stronger Futures in the Northern Territory | Stronger Futures in the Northern Territory National Partnership Agreement – Health. This 10 year agreement includes an investment of over \$700 million and aims to address persistent challenges experienced accessing health care services for Aboriginal people in the Northern Territory. Funding supports improved access, coordination and health care service delivery in remote areas, including facilitating delivery of specialist, dental and audiology health services for high disease burden conditions such as oral health and hearing health. | Commonwealth Department of Health The programme is delivered by a range of Aboriginal Community Controlled Health Services, Non-Government Organisations and the Northern Territory Government. | Services undertake a quarterly review of progress against agreed plans. Organisations provide an annual report of service activity. Clinical primary health care service providers report biannually on national key performance indicators. |
| Eye and Ear Health | Ear Health The Healthy Ears – Better Hearing, Better Listening Programme improves access to ear and hearing health services for Indigenous Australian children and youth, with a focus on rural and remote locations, by providing multidisciplinary outreach services. This is achieved by meeting the costs associated with | Commonwealth Department of Health Delivered by jurisdictional fundholders. | Quarterly financial and service activity reports |
| | delivering outreach services, such as travel, accommodation and venue hire. A range of health professionals are supported, such as medical specialists, GPs, nurses, audiologists and speech pathologists. Eye Health The Trachoma National Partnership Agreement aims to eliminate trachoma by 2020 by improving trachoma screening and treatment activities. Trachoma occurs primarily in remote and very remote Aboriginal communities in the Northern Territory, South Australia and Western Australia. | Commonwealth Department of Health and health departments in New South Wales, Northern Territory, Queensland, South Australia and Western Australia. Delivered by state governments. | 6 monthly reporting on activities and data collection through the Kirby Institute, University of NSW. |

|-------------------------|--------------------------|---------------------------|
|-------------------------|--------------------------|---------------------------|

| Program | Description | Budgetary context | Reporting |
|---|--|--|---|
| Visiting Optometrist Scheme (VOS) | The VOS improves access to optometric services for people living and working in rural and remote communities. This is achieved by addressing some of the financial disincentives incurred by participating optometrists providing outreach services, including travel, accommodation and facility fees. | Commonwealth Department of Health Delivered by jurisdictional fundholders | Six monthly financial and activity reports. |
| Australian Nurse Family Partnership Programme | The Australian Nurse Family Partnership Programme (ANFPP) is an evidence-based programme that aims to improve pregnancy outcomes by: helping women engage in good preventive health practices; supporting parents to improve their child's health and development; and helping parents develop a vision for their own future, including continuing education and finding work. The Programme is based on the US Nurse-Family Partnership® (NFP) model developed over the last 30 years by Professor David Olds and his team at the University of Colorado. In the 2014 Budget, the Australian Government provided additional funding from 2015-16 through the Better Start to Life approach for an additional 10 ANFPP sites to a total of 13 sites by 2018. | Department of Health to three Aboriginal Community Controlled Health Organisations to deliver the programme - Wellington Aboriginal Corporation Health Service (Wellington, NSW), Wuchopperen Health Service (Cairns, QLD), and Central Australian Aboriginal Congress (Alice Springs, NT). | Australian Nurse Family Partnership Programme - Quarterly fidelity and progress reports as well as six monthly financial reports. |

Table 10A.111 Australian Government, selected other community health programs

| Quality Assurance for Aboriginal and Torres Strait Islander Medical | • The Australian Government has funded the QAAMS programme since 1999, supporting the provision of culturally appropriate and clinically effective diabetes management in Aboriginal and Torres Strait Islander communities. | Chronic Disease Prevention and Service Improvement (CDPSI) Flexible Fund | Routine reporting – 6 monthly progress reports, including financial statement. |
| Services (QAAMS) Pathology Programme | | Flinders University and the Royal College of Pathologists of Australasia | |
| Australian National Diabetes Audit (ANDA) | The purpose of the ANDA is to undertake the collection, collation, analysis, audit and reporting of clinical diabetes and patient education and self-care data in specialist diabetes centres across all states and territories in Australia. The data collected is used by specialist diabetes centres to benchmark their practice processes and patient outcome data against that of their peers and provide cross-sectional data on the clinical status of individuals with diabetes attending these services. Data collection is conducted by the National Association of Diabetes Centres (NADC), which is a national collective of over 60 Diabetes centres across all states and territories. | Health Surveillance Flexible Fund Monash Health | Routine reporting – 6 monthly progress reports, including financial statement |

Table 10A.112 New South Wales, selected other community health programs

Selected other programs funded by the NSW Government during 2014-15

| Program | Description | Budgetary context | Reporting |
|--|---|--|--|
| Child Adolescent and Family Services | Covers services such as youth health, paediatric allied health (physiotherapy, occupation therapy, social work and counselling, speech pathology, psychology, audiology), specialist medical services, early childhood nursing, immunisation, post natal programs, early intervention and school surveillance services. Personal Health Record (PHR) - The NSW PHR (also known as 'the Blue Book') is distributed to all families with a newborn in NSW and provides a schedule of nine recommended child health checks from birth to four years of age. The PHR uses a joint parental-professional approach to detect or anticipate problems. Early Childhood Health Services provide a range of services to support good health outcomes of children, including parenting support and education, breastfeeding support, universal health home visiting, screening for postnatal depression and referral if necessary, and health and development advice for families with young children. | Local Health Districts (LHDs) receive block funding from the NSW Health to provide health services to their population. Each LHD determines how much money is allocated to this program. | The number of occasions on which one or more health care professiona provides services to a Non-admitted Patient is reported by LHDs to the Ministry of Health on a quarterly basis. |
| Universal Health Home Visiting | Universal Health Home Visiting (UHHV) – is the offer of a home visit by a Child and Family Health Nurse to all families in NSW after the birth of their baby. At the UHHV the nurse assesses the baby's health and development, and identifies the level of support the family needs. The nurse can then link parents identified as requiring additional support to appropriate support and/or secondary services. | Local Health District funds | Milestone reporting to Department or Premier and Cabinet; Quarterly acquittals to Treasury. |

REPORT ON GOVERNMENT SERVICES 2016

Table 10A.112 New South Wales, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--|---|--|---|
| Sustaining NSW Families | Sustaining NSW Families is a program of nurse led structured evidenced based sustained health home visiting provided to vulnerable children at risk of poor developmental outcomes and their families in selected low socio-economic areas. The program actively supports parents' aspirational goals for themselves and their child and builds parenting capacity and secure parent/ child relationships. It is prevention and early intervention strategy which commences in the antenatal period and continues until child is 2 years of age with the aim of optimising child health and development outcomes. Services include bi-lingual nurses (English/Arabic and English/Mandarin) and services in a rural area with a focus on engaging vulnerable Aboriginal families. | Local Health District funds | Milestone reporting to Department of Premier and Cabinet; Quarterly acquittals to Treasury. |
| Building Strong Foundations for Aboriginal Children Families and Communities | Building Strong Foundations for Aboriginal Children Families and Communities is a culturally safe early childhood health service for Aboriginal children birth to school entry age and their families. It aims to support parents and communities to provide an environment that will optimise the health, development and wellbeing of their child so that children are ready able to engage fully in life and learning. It has close links to Aboriginal maternity services including NSW Aboriginal Mothers and Infants Health Services and New Directions as well as mains team services. Teams comprising Aboriginal Health Workers and Child and Family Health nurses provide the main frontline service. Seven new sites were funded late 2011/12 bringing total to 15 across NSW. | State program funding to selected sites. | Milestone reporting to Department of Premier and Cabinet; Quarterly acquittals to Treasury. |

|-------------------------|-------------------|---------------------------|
|-------------------------|-------------------|---------------------------|

| Program | Description | Budgetary context | Reporting |
|-----------------------------|--|---|--|
| Family Referral Services | Family Referral Services (FRS) are intended to link vulnerable children, young people, and families with appropriate available support services in their local area. FRS refer clients to a range of local support services such as case management, housing, childcare, supported playgroup, drug and alcohol/mental health services, youth services, home visiting, family support, parenting education and respite care. The target group is vulnerable children and young people who are below the threshold for statutory child protection intervention, and their families. Government agencies, non-government organisations, and the private sector (e.g., general practitioners, childcare workers) can refer families to Family Referral Services. Families may also self-refer. There are 8 Family referral Services currently operating in NSW covering the following regional areas: Western NSW, Hunter Central Coast, Western Sydney (2), Illawarra, New England North West, Mid North Coast and Far North Coast. | Keep Them Safe 'protected item' funding. NSW Ministry of Health procures these services from non-government organisations on behalf of the whole of government. | Milestone reporting to Department of Family and Community Services. Quarterly acquittals to Treasury. |

Table 10A.112 New South Wales, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|---|--|---|--|
| Joint Investigation Response Teams (JIRT) | JIRT is collaborative arrangement between NSW Community Services, NSW Police and NSW Health. The primary aim of JIRT is to minimise the number of investigative interviews child victims of sexual abuse, physical abuse and extreme neglect have to undertake and to provide seamless service delivery to child victims and their non-offending family members. NSW Health became an equal partner in JIRT in 2009. As the 2012 JIRT Secretariat, NSW Health is responsible for leading the review of the JIRT Policy and Procedures Manual (2001), the Memorandum of Understanding between the three partner agencies and the Statewide Management Group's Terms of Reference. NSW Health is also in the final stages of recruiting and placing 24 Senior Health Clinicians in every JIRT office across the state. | LHDs receive global funding from the Ministry of Health via annual Service Agreements to provide health services to their population. JIRT funding is implemented within service agreement allocations. | Keep Them Safe (KTS) requires an audit of the JIRT Program every three years. An annual JIRT CEO Report Card is collated each year to meet the KTS audit requirements. |
| Maternal and child health | Maternity services are part of the core services provided by LHDs to their population. Community antenatal and postnatal care is provided including through shared care arrangements with GPs. Targeted programs for vulnerable populations include: - Aboriginal Maternal and Infant Health Service (AMIHS) provides culturally appropriate antenatal and postnatal care up to 8 weeks, to Aboriginal mothers and babies. Mental health and drug and | LHD block funding and some IECD NP funds (Commonwealth) | Regular reports on activity, outcomes against indicators |
| | alcohol secondary services are being delivered in selected AMIHS sites across the state as part of the Indigenous Early Childhood Development National Partnership Agreement (IECD NP). Quit for new life, a smoking cessation intervention specifically for Aboriginal pregnant women is also being rolled out across AMIHS programs. | | |

|--|--|---|--|
| Medical and forensic services for victims of sexual assault | This program area aims to improve forensic and medical services for victims of sexual assault and child abuse and ensure these services are culturally competent. The program has a particular focus on improving access in rural and remote communities. | Combination of Ministry of Health allocation, LHD block funding and Commonwealth funding (Indigenous Health-National Partnership Agreement) | LHDs report on service provision via a payment determination for a fee to be payable to non-salaried medical practitioners in designated rural LHDs conducting forensic and medical examinations for sexual assault victims. |
| New Street | New Street provides a coordinated, consistent, quality response to children and young people aged 10–17 years who sexually abuse and their families, through an expanded network of specialised NSW Health New Street services. New Street Services for Children and Young people have been enhanced through the establishment of an additional site in Newcastle (Hunter New England LHD), a new service in Dubbo (Western NSW LHD) and an additional clinical position at the Sydney and Central Coast New Street Service. A Clinical Advisor position for New Street Services and the Pre-Trial Diversion of Offenders Program has been created and filled. | LHD funding and Keep Them Safe funding | Milestone reporting to Department of Premier and Cabinet; Quarterly acquittals to Treasury on expenditure of Keep Them Safe component of the budget. |

Table 10A.112 New South Wales, selected other community health programs

Selected other programs funded by the NSW Government during 2014-15 Program Description Budgetary context Reporting Screening Domestic Violence Routine Screening - Women are routinely LHDs receive global funding from A one-month data collection snapshot screened for recent or current domestic violence in antenatal and the Ministry of Health via annual from all LHDs is conducted in early childhood health services, and women aged 16 and over are Service Agreements to provide November of each year. Domestic Covers screening and assessment programs particularly directed within service agreement Violence Routine Screening is also towards children to identify problems early so treatment options included within the Service Schedule allocations. are optimized. Program includes the Statewide Eyesight of the Ministry of Health and LHD Preschooler Screening (StEPS) program, Statewide Infant annual Service Agreements. Screening Hearing (SWISH) program, universal health home visiting for mothers and babies. Statewide Eyesight Preschooler Screening (StEPS) - is a free vision screening program for all four year old children in NSW. The program is designed to identify childhood vision problems early which cannot be detected by observation, behaviour, family history or vision surveillance. By identifying and treating vision problems during the critical visual development period, treatment outcomes can be maximised.

|--|--|---|--|
| Services for Children under 10 years with Problematic or Harmful Sexual Behaviour | Under Keep Them Safe (KTS) NSW Health committed to expanding services for children aged under 10 years who display problematic or harmful sexualised behaviour, including Aboriginal children. To increase service delivery, the Ministry of Health allocated KTS funding to enhance the Sparks program in the Hunter New England LHD, which is the only NSW Health specialist service responding to this client group. The Ministry is also developing a statewide policy directive and guidelines on best practice service delivery, including training requirements for staff, were necessary to resolve current issues and assist LHDs in their local responses to the target group. | LHD funding and Keep Them Safe 'protected item' funding | Milestone reporting to Department of Premier and Cabinet; Quarterly acquittals to Treasury on expenditure of Keep Them Safe component of the budget. |
| Sexual Assault Services | NSW Health's 55 Sexual Assault Services provide holistic specialist assistance to adult and child victims of sexual assault including supporting their psycho-social, emotional and cultural wellbeing. Free counselling, court support, medical and forensic examinations and medical treatment are available to anyone who has recently been sexually assaulted in NSW. | LHDs receive global funding from the Ministry of Health via annual Service Agreements to provide health services to their population. Sexual Assault Service funding is implemented within service agreement allocations. | Sexual Assault Services are included within the Service Schedule of the Ministry of Health and LHD annual Service Agreements. |
| Youth health and wellbeing | Provides education and health promotion programs, clinical services and planning of youth friendly services. Also provides specific health services for homeless and at risk young people. | A mix of LHD and Australian Government funding is allocated for Innovative Health Services for Homeless Youth (IHSHY). | The number of occasions on which one or more health care professional provides a services to a Non-admitted Patient and reported by the LHDs to the Ministry of Health on a quarterly basis. |

REPORT ON GOVERNMENT SERVICES 2016 PRIMARY AND COMMUNITY HEALTH PAGE **7** of TABLE 10A.112

 Table 10A.113
 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|---|--|---|---|
| Primary Care Partnerships (PCPs) Strategy | Primary Care Partnerships (PCPs) are cross government funded voluntary alliances of health, human services providers and other organisations. There are 28 PCPs in Victoria which engage over 600 organisations. PCPs deliver local service system reforms to: • improve the coordination of services • improve the way health promotion is planned, implemented and evaluated; and • improve the management of chronic disease. The strategy to improve the coordination of services is supported by a state-wide policy and operational framework and includes: • state-wide practice standards and a continuous improvement manual • tools for screening, referral and coordinated care planning • data standards for sharing client health and care information embedded in agency client management software applications; and • e-referral systems to securely share client information with client consent. PCPs identify local health and well being priorities and ways to address these priorities. 'Place based' partnership approaches are used to assess and engage with communities that experience significant disadvantage. Interventions may be targeted to particular population groups, for example, children or people with a refugee background. | Core funding provided by the Victorian Department of Health & Human Services. | Suite of reports as part of the 2013-17 PCP Program Logic. This includes a four year strategic plan and impact oriented reports against each area of the PCP program logic. |

Table 10A.113 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|---------------------------|--|--|--|
| Refugee Health Program | The Refugee Health Program (RHP) seeks to optimise the long-term health of refugees and asylum seekers by promoting accessible and culturally appropriate health care services that are innovative and responsive to their unique needs. The program supports a coordinated model of care, and acknowledges the importance of early identification and intervention in health issues in the early stages of settlement. The RHP has three aims: • to increase refugee access to primary health services • to improve the response of health services to refugees' needs; and • to enable refugee individuals, families and communities to improve their health and wellbeing. The RHP builds the capacity of individuals, families and refugee communities to improve their health through: disease management and prevention; the development of referral networks and collaborative relationships with general practitioners and other health providers; connection with social support and orientation programs. | The Victorian Government funds the RHP through the Department of Health & Human Services. Community health services are funded to deliver the RHP. | Community health services funded under the RHP report hours of service on a quarterly basis. |
| NURSE-ON-CALL | NURSE-ON-CALL is a statewide telephone-based health line that provides residents of Victoria with timely access to health information, assistance and advice for the cost of a local phone call. The service operates 24 hours, 7 days a week and takes about 1,000 calls per day. NURSE-ON-CALL uses registered nurses to triage callers' symptoms and health issues so as to advise on health care needs. NURSE-ON-CALL also provides callers with health information; and information about local health providers. In the after–hours period, approximately 50 eligible callers to NURSE-ON-CALL per day are transferred to the Commonwealth government's After Hours GP helpline. | NURSE-ON-CALL is delivered by Medibank Health Solutions under contract to the Department of Health & Human Services. | Medibank Health Solutions provides the department with a number of monthly reports. |

Table 10A.113 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--|--|---|---|
| IHSHY Program | The Innovative Health Services for Homeless Youth (IHSHY) program is an initiative that promotes health care for young people who are homeless or at risk of homelessness. Funding is provided to community health services to deliver innovative and flexible health services for the target population. The services respond to the complex health needs and improve their access to mainstream health services. IHSHY provides a means of engaging young people who may not otherwise access health services. | Community health services are funded to deliver the IHSHY program. | Community health services funded to deliver the IHSHY program report hours of service on a quarterly basis. |
| Healthy Mothers Healthy Babies antenatal program | The Healthy Mothers Healthy Babies program aims to reduce the burden of chronic disease and reduce health inequity by addressing maternal risk behaviours and providing integrated health and social care during pregnancy. The program is delivered by community health services in areas that have high numbers of births and higher rates of relative socioeconomic disadvantage. The objectives of the program are to: • improve women's access and attendance at antenatal and post natal services • improve women's access to a range of support services which may include health, welfare, housing and education services • deliver health promotion messages that aim to reduce risk behaviours, and promote healthy behaviours. Women eligible for the program are those women who are not able to access antenatal care services or require additional support because of their: • socioeconomic status • health status (e.g. mental health) and/or health behaviours (e.g. misuse of alcohol and other drugs) • culturally and linguistically diverse backgrounds • Aboriginal and Torres Strait Islander descent: or • residential distance to services. | The Victorian Government funds the program through the Department of Health & Human Services. | Quantitative performance targets are set by the Department of Health & Human Services and monitored quarterly. The program was monitored through a formal evaluation completed in November 2014. |

Table 10A.113 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|-------------------|--|---|--|
| Child Health Team | s Services for children and families within community health are based on evidence which identifies the significance of the early years. Through supporting early identification and treatment of health and developmental problems, community health services respond to the needs of young children and their families. Child health teams provide multidisciplinary care through a mix of group and individual interventions. Services promote positive health, growth and functioning within the community. Their focus is the provision of early interventions as well as to improve the capacity of parents and families to understand and manage the health and development needs of their child. Community health practitioners also support families to access additional services they may require in the community. | The Victorian Government funds the program through the Department of Health & Human Services. | Community health services providing child health services report hours of service as part of their overall community health program reporting on a quarterly basis |

Table 10A.113 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--------------------------|---|---|--|
| Community Health Program | The Community Health Program provides funding to 88 Community Health Services (CHSs) across Victoria. A strong connection to communities enables community health services to develop models of care that are responsive to their clients and reflect the diverse underlying determinants of health. In this way, community health services combine the social model of health with clinical care to maximise outcomes for their clients. CHSs play an important role in preventive, rehabilitative, maintenance and support services for people at risk of, or with complex conditions and chronic illnesses. In addition, community health prioritises services to population groups that are known to have poor health status, are subject to disadvantage or are at risk. These include people who are homeless or at risk of homelessness, refugees, Aboriginal people, people with an intellectual disability or a serious mental illness. Funding is provided for the provision of direct care, and for health promotion. CHSs are also major providers of Home and Community Care Services, Dental, General Practice, Drugs Program, Disability and other State and Commonwealth programs. | The Victorian Government funds the program through the Department of Health & Human Services. | Community health services report hours of service on a quarterly basis CHSs report annually to their consumers, carers, community and other stakeholders through the Quality of Care report. Agencies funded for health promotion are required to develop four year health promotion plans and report on those plans on an annual basis. |

Table 10A.113 Victoria, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--|--|--|---|
| Early Intervention i Chronic Disease (EliCD) | EliCD focuses upon community based early intervention services for people with chronic diseases. The aim of the initiative is to enhance existing capacity of community health services in supporting people with chronic disease in managing the impact of their condition including the physical, emotional and psychological impact of having a chronic disease. Services aim to reduce the impacts of chronic disease, slow disease progression and reduce potential/future hospitalisation. Models of care are multidisciplinary and provide self-management support, care coordination, education, allied health and nursing. | Community Health Services are funded to deliver the EliCD Program. | Community Health Services funded to deliver the EliCD Program report hours of service on a quarterly basis. |

Table 10A.114 Queensland, selected other community health programs

Selected other programs funded by the Queensland Government during 2014-15

| Program | Description | Budgetary context | Reporting |
|--|---|--|---|
| Blood Borne Viruses and Sexually Transmissible Infections (BBVs and STIs) | The program implements five national strategies 2014-17, covering HIV,Hepatitis B, Hepatitis C, Sexually Transmissible Infections and Aboriginal and Torres Strait Islander Blood Borne Viruses and Sexually Transmissible Infections. Services and public health programs are delivered through public, non-government and private organisations including 16 Hospital and Health Services (HHSs) Sexual Health Clinics providing preventative and clinical BBV and STI services. Clinical and funded non-government programs target groups most at risk of BBVs and STIs (e.g. men who have sex with men, injecting drug users, culturally and linguistically diverse people, Aboriginal and Torres Strait Islander people and young people). The HIV Foundation Queensland is tasked with leading the Queensland HIV prevention and testing response in conjunction with other Non-Government Organisations (NGOs) and the Department of Health. | Funded through the National Healthcare Agreement (NHA) and a combination of other Commonwealth and State Output Revenue. | Six monthly performance reports on activities by funded NGO programs. Quarterly report provided to the BBV and STI Standing Committee (BBVSS). Commonwealth Indigenous funding reports. Notification data for BBVs and STIs provided for the NHA report. Annual reports on Queensland notification data produced by Department of Health. |
| Child Health Services | A range of child health services are provided to children and young people aged 0-18 years and their families in the community. These services may include interventions such as child development checks, lactation support, parent information sessions; as well secondary and/or tertiary health services such as parenting and behaviour support, nutrition support, or referrals to other service providers. Services are available to all children and young people aged 0-18 years and their families as well as targeted services to particular or 'at risk' populations such as young parents, Aboriginal and Torres Strait Islander families, and refugee families. | State and Commonwealth government funding. Delivered by state government, may be delivered in partnership with other providers | Local Hospital and Health Service reporting arrangements are in place. |

Table 10A.114 Queensland, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|--|---|--|--|
| Enhanced Maternal and Child Health Service | The Mums and Bubs post-natal in home visiting program provides families with newborns home visits from qualified and experienced community midwives and/or child health nurses. All mothers, whether birthing in the public or private sector, can receive two post natal in-home visits within the first four weeks of giving birth. The Mums and Bubs program also ensures all families have access to community clinics at key stages during the first year of the child's life. | State government Delivered by state government, may be delivered in partnership with other providers. The Queensland Department of Health invested a total of \$8,540,998 in the Mums and Bubs program in 2014/15. | Quarterly reporting. |
| Preventive Health | Preventive Health Branch (PHB) provides expertise and leadership to improve policy, systems, research, programs and services to encourage healthy behaviours and create environments that are supportive of health. PHB works collaboratively across the Queensland Department of Health, with other government agencies, non-government organisations and the private sector on a range of health promotion, risk assessment, early intervention, personal skills development, and policy and legislative initiatives aimed at empowering individuals, communities and institutions to create and live healthier lives. Strategies target chronic disease risk factors – alcohol, tobacco, overweight and obesity, inadequate nutrition, physical inactivity - and skin cancer prevention. Interventions focus on children and young people, pregnant women, at risk adults, Indigenous and disadvantaged population groups, in key settings - workplaces, schools, healthcare, community and family. | Queensland Department of Health | Contractual performance reports; data collection; independent evaluations; internal reporting processes. |

Table 10A.114 Queensland, selected other community health programs

| Program | Description | Budgetary context | Reporting |
|---|---|--|---|
| Queensland Aboriginal and Torres Strait Islander health investment strategy | A range of primary and community health services are delivered across Queensland to improve the health outcomes of Aboriginal and Torres Strait Islander people and achieve the life expectancy and child mortality targets agreed through the Council of Australian Governments (COAG), including initiatives to strengthen the continuity of care between the acute and primary care settings. In 2013–14, 140 Aboriginal and Torres Strait Islander health initiatives and services were delivered by 16 HHSs and 19 Aboriginal and Torres Strait Islander community controlled health services and NGOs across Queensland. The range of initiatives and services included: • Hospital liaison support, case coordination and assistance for Aboriginal and Torres Strait Islander people entering and exiting acute care • Community-based and outreach antenatal, postnatal and infant care services • Targeted sexual and reproductive health prevention, early intervention, detection and education for young people and adults • Multidisciplinary primary healthcare services for the early detection, treatment and management of chronic diseases • Respiratory, diabetes and renal outreach services for Aboriginal and Torres Strait Islander people living in rural and remote areas • Alcohol, tobacco and substance misuse harm prevention, early intervention and treatment targeting Aboriginal and Torres Strait Islander young people, and • Mental health services. | Queensland Government and Australian Government funding responsibility (primary funding source Queensland Government—some funds provided by the Australian Government under the former Indigenous Early Childhood Development National Partnership Agreement—NPA). | Six monthly performance and financial reporting from the HHSs. Six monthly performance and quarterly financial reporting from th non-government sector. |

| Program | Description | Budgetary context | Reporting |
|---|---|---|---|
| WA Footprints To Better Health (formerly known as National Partnership Agreements for Closing the Gap in Indigenous Health Outcomes and Indigenous Early Childhood Development Element 3) | Closing the Gap and Indigenous Early Childhood Development (Element 3) programs previously funded under the NPA are now State funded under WA Footprints to Better Health (WAFBH). These programs promote increased access to: - timely and relevant health services that support growth and development of Aboriginal children - support services that improve the awareness and knowledge of risks associated with drug, alcohol and tobacco use among young people - Aboriginal-specific services that improve knowledge and practice of healthy lifestyle behaviours - chronic disease screening services and care planning - timely and culturally appropriate continuity of health care. The population group served by the program is Aboriginal people, specifically pregnant women and their partners, babies and parents, children, youth, women, men and elderly people. | WAFBH State funded Budget and governance oversight WACHS Aboriginal Health Improvement Unit Programs delivered by a mixture of government (WACHS and Metropolitan Area Health services) and non-government organisations (Aboriginal Community Controlled Health Organisations) | WACHS required biannual reporting from all Primary Health Care programs. Reports are reviewed to monitor performance. |
| NPA Indigenous Early Childhood Development (Element 2) | Commonwealth funding for the IECD (Element 2) NPA ceased in April 2015. The objective of this program is to increase access to teenage sexual and reproductive health and young parent support for Indigenous women. A range of services are offered, including health promotion/prevention, early intervention (screening) and treatment services. The primary population group served by this program is young Aboriginal women. | Element 2 - Commonwealth funded and ceased in April 2015 Budget and governance oversight WACHS Aboriginal Health Improvement Unit Programs delivered by a mixture of government (WACHS and Metropolitan Area Health services) and non-government organisations (Aboriginal Community Controlled Health Organisations) | WACHS required one report from COAG IECD Element 2 programs. Reports are reviewed to monitor performance. WACHS AHIU reported to DoHA for IECD programs in April 2015. |

|---|---|---|---|
| Primary health/chronic disease programs | WACHS Aboriginal Health Improvement Unit has carriage of several other contracted programs that provide primary health/chronic disease programs across the State in a community health care setting with a focus on the prevention, early detection, treatment and self-management of chronic disease. The population group served by this program is Aboriginal people, specifically those with or at risk of chronic disease. | Department of Health WACHS funding Budget oversight WACHS contracting Governance oversight WACHS Aboriginal Health Improvement Unit. Programs delivered through Aboriginal Community Controlled Health Organisations (nongovernment). | WACHS required biannual reporting from all Primary Health Care programs. Reports are reviewed to monitor performance. |
| Metropolitan Health Lifestyle Project | A coordinated patient-centred approach involving early patient identification, care co-ordination through general practice, trained clinic staff, supported allied health and community providers, clear referral pathways, and monitored patients to support lifestyle and risk modification for the target groups. The overall aim of the project is to provide practical support for people at risk of developing chronic disease or those who have chronic disease to make informed lifestyle choices and healthy behaviour change within the Perth metropolitan area. The primary target populations are those newly diagnosed with type 2 diabetes and those with microalbuminuria. The secondary target population is people with multiple risk factors for coronary heart disease. The program also includes: • Process and Outcome evaluation of the program to demonstrate the impact of the program on the community • Economic evaluation of the program on cost effectiveness. | Funding: WA Department of Health Contract : Health Strategy Networks DOH WA Program delivery - Fremantle Medicare Local | Six monthly reports Evaluation report Contract reports not available to the public Publication of research evaluation component of the report available |

| Program | Description | Budgetary context | Reporting |
|-----------------|---|--|--|
| Self-Management | Develop, deliver and evaluate programs to coordinate diabetes services and multidisciplinary care for persons with type 1 or type 2 diabetes. • Enhance care, access to care closer to home and navigation of the health system for people living with diabetes. • Build the capacity of GPs, practice nurses and other appropriate existing service providers in the community, including use of Chronic Disease Management Medicare Items and Medicare diabetes incentives. • Facilitating and encouraging access to self-management education, care and support with multidisciplinary input from appropriate health professionals. • Delivery of self-management education programs and services. • Linking with other local services/programs such as local government recreational services and support groups. • Development of referral pathways between tertiary, secondary and community based services, including coordinating clients referred from GPs, hospitals and Health Services to appropriate diabetes clinics/services in the metropolitan and regionals areas for ongoing management. • Incorporate the relevant WA Health Models of Care where appropriate. | Funding: DOH WA Contract: Health Strategy Networks DOH WA Program delivery – • Medicare Locals • Diabetes WA | Six monthly reporting Evaluation report Contract reports not available to the public |

|---|---|--|--|
| Primary Health Services for People Experiencing Homelessness | The service includes the following elements: • Builds relationships with individuals affected by homelessness based on trust and a sense of community. • Flexible arrangements to respond to movements in location of people experiencing homelessness. • In-reach service to specialist homeless service providers. • Primary health care services • Health care plans to identify and manage individual health needs. • Information on health issues and self-care education. • A collaborative approach to service provision with other providers of health and specialist homelessness services. • Referrals and linkages to other health, specialist homelessness, mental health, and alcohol and drug services. | Funding: DOH WA Contract: Health Strategy Networks DOH WA Program delivery – Perth Mobile GP, trading as Mobile GP | Six monthly reporting Contract reports not available to the public |

| Program | Description | Budgetary context | Reporting |
|-----------------------|---|---|---|
| Child health services | Child health services aim to promote improved health outcomes for babies, young children and their families through the provision of a range of universal and targeted prevention, early identification and intervention services. Services are delivered in various settings, including child health centres, in homes, parenting groups and other community venues. The WA universal Birth to School Entry community child health service offers child health nurse contacts to all mothers of new babies within 10 days of birth and an additional six contacts at critical points in the child's development throughout the first four years of life. Follow up checks are offered to individual families and groups according to need. Information and support is offered regarding parenting, child health and development, child behaviour, maternal health and wellbeing, child safety, immunisation, lactation, breastfeeding and nutrition. | State funding is provided for both child and school health services. Health services are responsible for delivering child health services. Agreement between the Department of Education and Department of Health, which underpins the delivery of School Health Services. Health services are responsible for managing community health services, and for delivering the majority of services. Service agreements are in place with nongovernment organisations for the provision of certain services in particular geographical areas to supplement those provided by the health service. | Services are reported as Occasions of Service (for non-admitted patients). Reports are produced as required for service planning, governance, management and reviews. Quarterly reports against key performance indicators are provided to the Government. Service delivery reports are not accessible to the public. |

Selected other programs funded by the WA Government during 2014-15

Targeted services Targeted services focus on engaging vulnerable children and families who are at greater risk of health and developmental issues, including Refugees, Aboriginal families and young parents with identified risks. Targeted programs include Best Beginnings, which is delivered in collaboration with the Department for Child Protection and Family Support, and the Enhanced Aboriginal Child Health Schedule (EACHS). These programs provide a modified and expanded version of the Universal Child Health Contact Schedule.

Families eligible to receive the EACHS are offered 15 scheduled contacts, from pregnancy to five years of age, in a culturally appropriate manner.

Other targeted metropolitan services include Lactation Consultancy and Aboriginal ear health clinics, which provide children with otitis media or known suspected hearing problems with access to an Aboriginal Health Worker, Audiologist, Speech Pathologist and Ear, Nose and Throat specialist. This is to mitigate factors that might lead to ongoing poor health and education outcomes.

Budgetary context

State funding is provided for both child and school health services. Health services are responsible for delivering child health services.

Health services are responsible for managing community health services, and for delivering the majority of services. Service agreements are in place with nongovernment organisations for the provision of certain services in particular geographical areas to supplement those provided by the health service.

Reporting

Services are reported as Occasions of Service (for non-admitted patients). Reports are produced as required for service planning, governance, management and reviews. Quarterly reports against key performance indicators are provided to the Government. Service delivery reports are not accessible to the public.

Selected other programs funded by the WA Government during 2014-15

| Program | Description | Budgetary context | Reporting |
|------------------------------|--|---|---|
| School health services | School health services support the health and development of all students in government and non-government schools through universal health assessments at school entry, support to students with particular health needs, health promotion strategies and early detection. Services are provided on school sites in collaboration with education providers. In secondary government schools, the focus is more on health promotion (e.g. mental health, sexual health) and providing students access to a health professional who can advise, assess and refer, according to the presenting health issue. In Education Support Schools, nurses provide direct health care services for students with disabilities, many of whom have multiple disabilities. | State funding is provided for school health services. Health services are responsible for delivering school health services. Agreement between the Department of Education and Department of Health underpins the delivery of School Health Services. The Department of Education part funds School Health Services in WA, as agreed in the MOU between the Departments. | Services are reported as Occasions of Service (for non-admitted patients). Reports are produced as required for service planning, governance, management and reviews. Six monthly reports against key performance indicators are provided to the Government. Service delivery reports are not accessible to the public. |
| Child Development Service | The metropolitan Child Development Service in Perth, Western Australia, provides community-based assessment and intervention services for children 0-18 years with (or at risk of) developmental delays and disorders. The Child Development Service also plays a key role in community education and professional development. The Child Development Service clinical workforce consists of a range of allied health and medical disciplines, including Speech Pathologists, Physiotherapists, Occupational Therapists, Clinical Psychologists, Social Workers and Paediatricians. | State funding is provided. Health Services are responsible for delivering child development services. Health services are responsible for managing child development services, and for delivering the majority of services. Service agreements are in place with nongovernment organisations for the provision of certain services in particular geographical areas to supplement those provided by the health service. | Services are reported as occasions of service (for non-admitted patients). Reports are produced as required for service planning, governance, management and reviews. Quarterly reports against key performance indicators are provided to the Government. Service delivery reports are not accessible to the public. |

| Description | Budgetary context | Reporting |
|--|---|---|
| Primary Health brings together a wide range of community and rural health services to meet the needs of both individuals and local communities. Community Health Centres offer a variety of services including counselling and support, health promotion, medical, nursing, allied health services and accommodation and meeting spaces for visiting services including housing, disability and family and child health services. | The majority of funding is allocated from the State budget. During 2014-15 Tasmania's three Health Organisations (North, South and North West) were merged into a single Tasmanian Health Service which is responsible for area spending and overseeing program delivery. | Performance information is collected and reported at the State level through the Budget Papers, Annual Report and the HealthStats Website. |
| Services vary from site to site based on community need and accessibility to similar services provided by government or non-government providers. The size of sites also varies: small sites provide a limited range of services generally based around community nursing. | Services are provided in accordance with the Tasmanian Government's Output Budgeting Framework. Services are funded through identified outputs within the DHHS budget. | National reporting through: National Minimum Data Sets; Report on Government Services; Australian Institute of Health and Welfare (AIHW); Australian Council of Healthcare Standards. |
| Rural Health Facilities provide core primary health and community care services within a local community in addition to some inpatient sub-acute beds. In addition, some rural sites provide residential aged care and/or emergency services. | Australian Government funds | Reporting in accordance with specific program requirements. |
| Palliative Care Services - specialist palliative care clinicians work within a consultancy framework across the health sector to support primary health service providers in urban and rural areas to provide quality palliative care | Australian Government funds | Reporting in accordance with specific program requirements. |

| Program | Description | Budgetary context | Reporting | |
| Healthy School-Age Kids Program | The Healthy School-Age Kids Program is a health promotion and screening program provided to all school-age children in remote communities. The program includes an integrated approach to | Funding source and program management: NT Dept of Health | Activity reporting by community by event | |
| | screening and health promotion activities from a number of different health service providers, non-government organisations and schools. This program supports the NT Childhood Vaccination Schedule. | Program service delivery: • Top End Health Service • Central Australia Health Service • two Aboriginal Medical Services in the Katherine region | NT Department of Health Annual Report (public) | |
| Prison Health Care | The Prison Health Care program delivers evidence-based, best practice primary health care services to prison inmates at the Darwin Correctional Centre, Don Dale Centre and the Alice Springs Correctional Centre. A multi-disciplinary team provides integrated and coordinated primary health care, 24-hour on-call emergency care, medical evacuations and chronic disease care and treatment. The program manages the relationship between itself and private allied health providers involved in primary health care service in the prisons and works collaboratively with other departmental program professionals to deliver public health programs. Consultation occurs with the community, inmate advocate groups and the Department of Correctional Services to foster and develop effective governance systems. | Funding source: Northern Territory Government through the Department of Health Program budget spending/oversight: NT Department of Health Governance oversight and program delivery: Top End Health Service Central Australia Health Service | NT Department of Health Annual Report (public) National Prisoner Health Information Committee | |

| Chronic Conditions Strategy Unit (CCSU) | CCSU supports the chronic disease network across the Northern Territory to provide evidence-based, best practice within the chronic conditions prevention and management strategy framework. It provides leadership to ensure a consistent approach to chronic care and works closely with its partners within and outside the government health sector, including non-government and Aboriginal community controlled health services. | Funding source: • Australian Government via the National Partnership Agreement • Northern Territory Government through the Department of Health | NT Department of Health Annual Report (public) |
| Trachoma | The Northern Territory Trachoma Program undertakes trachoma control activities in all remote communities in the NT with the aim of eliminating trachoma by 2020. The program provides early detection and intervention services through the screening and treatment for active trachoma infection in all Aboriginal children aged five to nine years living in remote communities. Treatment is provided to entire communities where required and Aboriginal adults aged 40 years and over are screened and treated for trichiasis. To prevent the transmission of infection, the program promotes health campaigns aimed at increasing facial cleanliness and improving environments. To overcome cultural/language barriers, the program conducts extensive community consultation, engages community based workers and has collaborated with other programs to develop culturally appropriate and/or translated resources. The populations served by the program include Aboriginal Territorians in remote communities. | Funding source: • Australian Government via the National Partnership Agreement for Improving Trachoma Control Services for Indigenous Australians Program management and delivery: • NT Department of Health • NT Aboriginal Medical Services | Six monthly report to Australian Government against partnership agreement milestones 12 monthly report to Kirby Institute NT Department of Health Annual Report (public) |

|---|--|---|--------------------------------|
| Sexual Health and Blood Borne Viruses Program | The Sexual Health and Blood-Borne Viruses Program is an NT wide program aimed at prevention, treatment, surveillance and control of sexually transmitted infections (STIs) and blood borne viruses (BBVs). Services include: • surveillance and public health response to notifiable STIs and BBVs • early detection and treatment through direct clinical services in five sexual health clinics • providing technical and financial support to primary health care services and health promotion programs in remote areas • funding community based organisations to engage communities in STI and BBV prevention programs • needle syringe program • clinical education • sexuality health education and promotion activities • support for research, involving both local and national partnerships. The program overcomes: • cultural/language barriers through delivery of culturally appropriate educational and clinical services • service barriers through integration of sexual health service delivery into primary health care to ensure a comprehensive sexual health program • gender-related barriers by ensuring a gender balance of staff. | Northern Territory Government through the Department of Health. | Adolescent Sexuality Education Project (ASEP) | The Adolescent Sexuality Education Project (ASEP) provides sexual and reproductive health education to young Aboriginal adolescents in school and community settings across the NT. ASEP is a collaborative effort between the NT Department of Education and Department of Health in association with the Central Australia Aboriginal Congress. The program embraces a community development approach to build the capacity of local people to deliver sexuality education in remote NT communities. Sexual and reproductive health education resources are adapted to suit local needs based on community consultation and the requirements of local community based educators. This approach has resulted in the establishment of a consistent and culturally appropriate sexuality education and illness prevention program that overcomes cultural/language barriers. The program also ensures a mix of male and female community based educators to overcome gender-related barriers. Population groups served by the program are mainly Aboriginal adolescent Territorians living in remote communities. | Funding sources: • Australian Government via the Project Agreement for Indigenous Teenage Sexual and Reproductive Health and Young Parents Support (ceased 30 June 2015) • NT Government awarded a three month extension for the program from 01 July 2015 (set to expire 30 September 2015) Program management and delivery: • NT Department of Health • Top End and Central Australia Health Services | Final report to Australian Government on project agreement milestones NT Department of Health Annual Report (public) |

| Program Tuberculosis and Leprosy Program | Description A range of services are provided by the Centre for Disease Control for the management of tuberculosis (TB), leprosy and non-tuberculous mycobacteria in the NT. The aim of the program is to provide timely, evidence based healthcare that meets individual needs and facilitates access to appropriate services. It also aims to maximise efficiency through combined education and training of mycobacterial staff in the control of TB and leprosy. Services include • remote area visits (including home visits) and education sessions • early detection/intervention through client monitoring and contact tracing to identify people at risk • screening for TB exposure in alcohol rehabilitation centres, prison, renal units and aged care • directly observed therapy to prevent the development of drug resistant disease. The program overcomes cultural/language barriers by using interpreter services and translated educational material. Populations served by the program include Aboriginal Territorians, health-care workers, overseas-born non-asylum seekers and | Funding sources: Northern Territory Government through the Department of Health Department of Immigration and Boarder Protection via the agreement for the Provision of Health Services to Detainees Program management and delivery: NT Department of Health through the Centre for Disease | Reporting NTG Budget Paper No. 3 (public) NT Department of Health, Annual Report (public) |

| Australian Bat Lyssavirus Pre and Post Exposure Prophylaxis (and rabies post exposure) Service | The service promotes health and prevents illness caused by exposure to the Australian Bat Lyssavirus (ABL) and rabies virus. Preventative education programs are provided NT wide to ensure people avoid contact with bats in Australia and animals in countries where rabies is prevalent. These programs also instruct people bitten or scratched by bats in Australia and returning travellers bitten or scratched by animals in countries where rabies is prevalent to seek appropriate treatment. The Centre for Disease Control delivers technical knowledge on ABL pre and post exposure prophylaxis for the NT community and provides: • (privately purchased) vaccine for pre-exposure prophylaxis against ABL to persons at risk of occupational exposure • post-exposure rabies immunoglobulin and (privately purchased) vaccine to those potentially exposed to both rabies virus and ABL. | Funding sources: Northern Territory Government through the Department of Health Program management and delivery: NT Department of Health through the Centre for Disease Control | NT Department of Health, Annual Report (public) Post exposure prophylaxis use is reported to the Australian Government |

Data quality information — Primary and community health, chapter 10

Data quality information

Data quality information (DQI) provides information against the seven ABS data quality framework dimensions, for a selection of performance indicators in the Primary and community health chapter. DQI for additional indicators will be progressively introduced in future reports.

Technical DQI has been supplied or agreed by relevant data providers. Additional Steering Committee commentary does not necessarily reflect the views of data providers.

DQI Contents

| Availability of PBS medicines | 3 |
|---|----|
| Measure 1: Approved providers of PBS medicines by PhARIA area | 3 |
| Measure 2: PBS expenditure per person by region | 5 |
| Measure 3: Equity of access to PBS medicines | 6 |
| Equity of access to GPs | 7 |
| Measure 1: Availability of GPs by region | 7 |
| Measure 2: Availability of GPs by sex | 9 |
| Early detection and early treatment for Indigenous people | 11 |
| Proportion of children receiving a fourth year developmental | |

| Measure 2: Management of asthma | 43 |
| Use of pathology tests and diagnostic imaging | 46 |
| Patient satisfaction | 48 |
| Cost to government of general practice per person | 52 |
| Child immunisation coverage | 54 |
| Notifications of selected childhood diseases | 56 |
| Participation rates for women in cervical screening | 58 |
| Selected potentially preventable hospitalisations | 60 |
| Measure 1: Selected potentially preventable hospitalisations for vaccine preventable, acute and chronic conditions | 60 |
| Measure 2: Selected potentially preventable hospitalisations for diabetes | 65 |
| Measure 3: Potentially preventable hospitalisations of older people for falls | 68 |

Availability of PBS medicines

Data quality information for this indicator has been developed by the Health Working Group with additional Steering Committee comments.

Measure 1: Approved providers of PBS medicines by PhARIA area

Indicator definition and description

Element Equity — Access

Indicator Equity of access to PBS medicines

Measure/s Definition

(computation) • Approved providers of PBS medicines by Pharmacy Access/Remoteness Index of

Australia (PhARIA) area.

Numerator: ABS Census population data by PhARIA area

Denominator: Number of approved providers of PBS medicines by PhARIA area.

Computation: Numerator ÷ Denominator.

Data source/s University of Adelaide's National Centre for Social Applications of Geographic

Information Systems, using Department of Human Services, Medicare pharmacies data

and ABS ERP data.

Data Quality Framework Dimensions

Institutional environment

Australian Government Department of Health, PBS data are an administrative by-product of claims for PBS reimbursement and details on under co-payment scripts submitted by pharmacists.

Relevance

Data are presented by State/Territory by PhARIA area. Data include community pharmacies as well as GPs and Aboriginal Health Services approved to supply PBS medicines under the *National Health Act* 1953 (Cwlth).

PhARIA is a composite index, which incorporates measurements of general remoteness, as represented by ARIA+, with a professional isolation component represented by the road distance to the five (5) closest pharmacies (University of Adelaide Australian Population and Migration Research Centre). The University of Adelaide assign a PhARIA classification category (categories 1-6) to the ABS Census population - SA1 population data. The six PhARIA classification categories are:

Category 1 - Highly Accessible

Category 2 - Accessible (Group A)

Category 3 - Accessible (Group B)

Category 4 - Moderately Accessible

Category 5 - Remote

Category 6 - Very Remote

General practitioners are able to obtain approval to supply PBS medicines under S92 of the *National Health Act 1953* (Cwlth). This requires that: 'where there is no pharmacist approved in respect of premises from which, in the opinion of the Secretary, a convenient and efficient pharmaceutical service may be supplied in a particular area and a medical practitioner is practising in that area, the Secretary may approve the medical practitioner for the purpose of supplying pharmaceutical benefits to persons in that area'.

To be eligible to supply PBS medicines under section S100 of the *National Health Act* 1953 (Cwlth), an Aboriginal Health Service (AHS) must meet the requirements of the National Health (Remote Aboriginal Health Services Program) Special Arrangements Instrument 2010, which states that the clinic or other health care facility operated by the AHS, from which pharmaceutical benefits are supplied to patients, must be in a remote

zone as defined in the Rural, Remote and Metropolitan Areas Classifications (RRMA), 1991 Census Edition (RRMA 6 - Remote Centres and RRMA 7 - Other Remote Areas).

Timeliness Reliable PBS data are available 16 weeks after the close of the reference period.

Accuracy The supply data has an accuracy of approximately 98 per cent after 16 weeks.

Coherence Estimates are compiled the same way across regions and over time. Data as at June for 2013 and subsequent years are derived using ABS 2011 Census-based PhARIA areas.

Data as at June for for previous years use ABS 2006 Census-based PhARIA areas.

Accessibility Information is available for PBS data from www.pbs.gov.au/info/browse/statistics.

Interpretability PBS statistics and explanatory notes are published at www.pbs.gov.au/pbs/home.

Data Gaps/Issues Analysis

Key data gaps /issues

- Data are for the first time reported for a composite measure of access to PBS
 medicines that includes GPs and Aboriginal Medical Services approved to supply
 PBS medicines in locations where community pharmacies are less accessible. Data
 therefore represent access to PBS medicines after government measures to improve
 access in areas of market failure such as remote/very remote areas. This has
 particular relevance for the NT, as more than 40 per cent of the population live in
 such areas.
- Data are for the first time disaggregated for all PhARIA categories (previously reported only for PhARIA 1 and the combined areas PhARIA 2–6.

Measure 2: PBS expenditure per person by region

Indicator definition and description

Element Equity — Access

Indicator Equity of access to PBS medicines

Measure/s Definition:

(computation)

• Expenditure on Pharmaceutical Benefits Scheme (PBS) medicines divided by the

ERP, by remoteness area

Numerator: Expenditure on PBS medicines

Denominator: ERP

Computation: Numerator + Denominator.

Data source/s Numerator: Australian Government Department of Health, PBS Statistics

Denominator: ABS ERP as at 30 June preceding the reference year from 2012-13.

Data Quality Framework Dimensions

Institutional environment

PBS expenditure data are an administrative by-product of claims for PBS reimbursement and details on under co-payment scripts submitted by pharmacists.

Relevance

Data exclude expenditure on doctor's bag and other categories administered under special arrangements, such as, medications supplied to Aboriginal Health Services in remote and very remote areas under s.100 of the *National Health Act 1953* (Cwlth) for the purpose of improving access to PBS medicines for Indigenous people and others located in those areas. This expenditure, \$29.3 million in 2014-15, is not suitable for computation of expenditure per person as 'catchment' areas for Aboriginal Health Services cross regional boundaries.

Geographical location is based on the ABS Australian Statistical Geography Standard 2011 (ASGS) classification from 2012-13. For previous years, geographical location is based on the Rural, Remote and Metropolitan Area (RRMA) classification. This constitutes a break in time series; data from 2012-13 are not comparable with data for previous years.

Timeliness

Reliable PBS data are available 16 weeks after the close of the reference period.

Accuracy

The supply data has an accuracy of approximately 98 per cent after 16 weeks.

Coherence

Estimates are compiled the same way across regions.

The change to ASGS based geographical location from 2012-13 from RRMA based geographical location for previous years constitutes a break in time series. Data from 2012-13 are not comparable with data for previous years.

Data are not directly comparable to data published in the Australian Government Department of Health annual report, which are prepared on an accrual accounting basis and include doctor's bag and other categories administered under special arrangements (such as medications dispensed to remote and very remote areas under s.100 of the *National Health Act 1953* [Cwlth].)

Accessibility

Information is available for PBS data from www.pbs.gov.au/info/browse/statistics.

Interpretability

PBS statistics and explanatory notes are published at www.pbs.gov.au/pbs/home.

Data Gaps/Issues Analysis

Key data gaps /issues

- Data are reported only at the national level; reporting by State/Territory is a priority
- Data exclude medications supplied to Aboriginal Medical Services in remote and very remote areas under s.100 of the National Health Act 1953 [Cwlth] for the purpose of improving access for Indigenous people and others located in those areas.

Measure 3: Equity of access to PBS medicines

Indicator definition and description

Element Equity — access

Indicator Equity of access to PBS medicines

Measure/s (computation)

Proportion of PBS prescriptions filled at a concessional rate

Definition:

• The number of PBS prescriptions filled at a concessional rate, divided by the total

number of prescriptions filled.

Numerator: The number of PBS prescriptions filled at a concessional rate

Denominator: The total number of prescriptions filled

Computation: Numerator ÷ Denominator

Data source/s Australian Government Department of Health, PBS Statistics.

Data Quality Framework Dimensions

Institutional environment

PBS expenditure data are an administrative by-product of claims for PBS reimbursement and details on under co-payment scripts submitted by pharmacists.

Relevance Data are reported by State/Territory.

Timeliness Reliable PBS supply data are available 16 weeks after the close of the reference period

Accuracy The supply data has an accuracy of approximately 98 per cent after 16 weeks.

Coherence Estimates are compiled the same way across jurisdictions and over time.

Accessibility Information is available for PBS data from www.pbs.gov.au/info/browse/statistics

Interpretability PBS statistics and explanatory notes are published at www.pbs.gov.au/pbs/home

Data Gaps/Issues Analysis

Key data gaps /issues The Steering Committee notes the following issues:

 Data do not capture medicines supplied by Aboriginal Medical Services in remote and very remote areas under s.100 of the National Health Act 1953 [Cwlth] for the purpose of improving access to medicines for Indigenous people and others located in these areas. This has particular relevance for the NT as around 43 per cent of the population live in these areas.

Equity of access to GPs

Data quality information for this indicator has been developed by the Health Working Group with additional Steering Committee comments.

Measure 1: Availability of GPs by region

Indicator definition and description

Element Equity — access

Indicator Equity of access to GPs

Measure/s (computation)

Availability of general practitioners (GPs) by region.

Definition:

Numerator: Number of FSE GPs

Denominator: Estimated Resident Population (ERP) by region.

Computation: 100 000 × (Numerator ÷ Denominator).

Data source/s Numerator: Australian Government Department of Human Services (DHS), Medicare

data.

Denominator: Australian Bureau of Statistics (ABS) Estimated Resident Population

• The number of Full Service Equivalent (FSE) GPs per 100 000 people, by region.

(ERP) as at 30 June preceding the reference year.

Data Quality Framework Dimensions

Institutional environment

MBS claims data are an administrative by-product of the DHS, Medicare fee for-service payment systems. DHS, Medicare collects MBS data under the *Human Services* (Medicare) Act 1973 (previously Medicare Australia Act 1973) and regularly provides the data to Australian Government Department of Health.

Relevance

Geographical location based on the ABS Australian Statistical Geography Standard 2011 (ASGS) classification.

GP headcount and FSE figures include vocationally recognised as well as non vocationally recognised general practitioners ('Other medical practitioners' (OMP)).

GP headcount is a count of all GPs who have provided at least one DHS, Medicare service during the reference period and have had at least one claim for a DHS, Medicare service processed during the same reference period.

GP headcount is generally an unreliable measure of workforce supply in Australia due to the high proportion of casual and part-time practitioners accessing DHS, Medicare. FSE is an estimated measure of medical workforce based on Medicare claims information. Although Medicare claims data does not include information on hours worked it does have sufficient time-based items to estimate a proxy for hours worked. The FSE methodology models total hours worked for each practitioner based on the number of days worked, volume of services, and schedule fees. One FSE is approximately equivalent to a workload of 7.5 hours per day, five days per week. The FSE for each practitioner is capped at 2.5.

A GP can work at more than one location. Allocation of GP headcount to state or territory and region is based on the practice location at which the GP provided the most DHS, Medicare services during the reference period. FSE allocates activity based on the practice location at which services were rendered within the reference period.

Timeliness

GP headcount and FSE figures are available 10 weeks after the close of the reference period.

Accuracy

GP headcount figures include only those GPs that both claimed and provided a service in the reference period. A small number of GPs may provide services in one year for which all claims are not processed until the next year. As additional months or DHS, Medicare claims data are processed, a small number of providers will become eligible

for inclusion in the headcounts. Revision of headcount figures will result in very small differences to published figures each year. FSE figures are not revised each year.

Since the commencement of DHS, Medicare, practitioners have provided demographic information to DHS, Medicare including date of birth and gender. Demographic details are updated when practitioners review, renew or change their registration details with DHS, Medicare Australia. While the demographic data for current practitioners is generally very accurate and complete, there are some instances of missing data.

To overcome the problems and biases posed by missing data, similar practitioners were grouped based on known demographic information and missing demographic field/s were imputed using a standardised method to maintain data integrity. As a result, some minor changes to the distribution of GPs based on GP age or gender may occur when newly released figures are compared with previous versions.

Coherence

Estimates are compiled the same way across jurisdictions and over time.

This is the first year that the FSE estimate of GP workforce is used. Historical data have been revised and so there is coherence over time in the data presented in this Report. However, data are not comparable with data in previous editions of the report which used a different methodology (Full-time Work Equivalent) to estimate workforce.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm id=9.

Interpretability

General practice statistics, including explanatory notes, are published at www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

- The classification system used to allocate GPs to regions from the reference year 2012-13 is current, a major improvement over data for previous years which were based on a system developed in 1994
- Data are reported for 5 regional categories from 2012-13, compared to only 2 broad regional categories for previous years.

Measure 2: Availability of GPs by sex

Indicator definition and description

Element Equity — access

Indicator Equity of access to GPs by sex

Measure/s (computation) Availability of general practitioners (GPs) by sex.

Definition:

• The number of Full Service Equivalent (FSE) female GPs per 100 000 females

• The number of FSE male GPs per 100 000 males

Numerator: Number of FSE GPs by sex.

Denominator: Estimated Resident Population (ERP) by sex.

Computation: 100 000 × (Numerator ÷ Denominator).

Data source/s Numerator: Australian Government Department of Human Services (DHS), Medicare

Denominator: Australian Bureau of Statistics (ABS) Estimated Resident Population

(ERP) as at 31 December preceding the reference year.

Data Quality Framework Dimensions

Institutional environment MBS claims data are an administrative by-product of the DHS, Medicare fee-for-service payment systems. DHS, Medicare collects MBS data under the Human Services (Medicare) Act 1973 and regularly provides the data to Australian Government Department of Health.

Relevance

FSE GP figures include vocationally recognised as well as non-vocationally recognised general practitioners ('Other medical practitioners' (OMP)).

GP headcount is generally an unreliable measure of workforce supply in Australia due to the high proportion of casual and part-time practitioners accessing DHS, Medicare. FSE is an estimated measure of medical workforce based on Medicare claims information. Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

• Data are of acceptable accuracy.

Early detection and early treatment for Indigenous people

Data quality information has been developed for this indicator by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element Equity — access

Indicator Early detection and early treatment for Indigenous people

Measure/s (computation)

Measure 1

Definition:

 The proportion of older people who received a health assessment by Indigenous status.

Numerator:

The number of people aged 75 years or over with an MBS claim for Items 700, 701, 702, 703, 705 or 707 (Health assessment) and the number of people aged 55 years or over with an MBS claim for Items 704, 706, 708, 710 or 715 (Health Assessment for Aboriginal and Torres Strait Islander People) in the reference period

Denominator:

• The population of Indigenous people aged 55 years or over and the estimated population of non-Indigenous people aged 75 years or over (computed by subtracting the projected population of Indigenous people aged 75 or over from the ERP aged 75 years or over) in the reference period.

Computation: 100 × (Numerator ÷ Denominator), presented as a percentage.

Measure 2

Definition:

 The proportion of older Indigenous people who received a health assessment, time series.

Numerator: The number of people aged 55 years or over with an MBS claim for Items 704, 706, 708, 710 or 715 (Health Assessment for Aboriginal and Torres Strait Islander People) in the reference period.

Denominator: The population of Indigenous people aged 55 years or over in the reference period.

Computation: 100 × (Numerator ÷ Denominator), presented as a percentage.

Measure 3

Definition:

• The proportion of Indigenous people who received a health assessment, by age group.

Numerator:

• The number of people aged 0–14 years, 15–54 years, or 55 years or over with an MBS claim for Items 704, 706, 708, 710 or 715 (Health Assessment for Aboriginal and Torres Strait Islander People) in the reference period.

Denominator:

 The population of Indigenous people aged 0–14 years, 15–54 years, and 55 years or over in the reference period.

Computation: 100 × (Numerator ÷ Denominator), presented as a percentage.

Data sources (all measures)

Numerator: Australian Government Department of Human Services (DHS), Medicare data.

Denominator: computed by the Secretariat using Estimated Residential Population (ERP) data from the Australian Bureau of Statistics (ABS).

- Total: ABS various years, Australian demographic statistics, Cat. no. 3101.0.
- For data by Indigenous status: ABS 2014, Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, Cat. no. 3238.0 (B Series).

Data Quality Framework Dimensions

Institutional environment

MBS claims data are an administrative by-product of the DHS, Medicare fee for-service payment systems. DHS, Medicare collects MBS data under the *Human Services* (*Medicare*) *Act 1973* and regularly provides the data to Australian Government Department of Health.

The indicator was calculated by the Secretariat from numerator data supplied by Australian Government Department of Health and ABS-sourced denominator data.

Relevance

These measures relate to specific DHS, Medicare services for which claims data are available.

Indigenous status is determined by self-identification. Indigenous people aged 75 years or over may have received a health assessment under the 'all older people' MBS items. This is considered unlikely to affect overall proportions significantly because the life expectancy of Indigenous people is, on average, relatively low.

Allocation of clients to state or territory is based on client postcode of residence as recorded by DHS, Medicare at time of processing the final claim in the reference period. This might differ from the client's residential postcode at the time the service was received, and might not be where the service was provided.

For services provided from 1 May 2010, disaggregation by age is based on client date of birth in DHS, Medicare records at the date the service was received. Prior to 1 May 2010 unique MBS item numbers applied to each age group.

Eligible populations exclude people who are hospital in-patients or living in a residential aged care facility.

Timeliness

MBS claims data are available within 14 days of the end of a month.

Accuracy

Data include all claims processed up to 12 months after the service is received. Current year data are preliminary and subject to revision in subsequent reports.

Allocation to state and territory does not necessarily reflect the client residence at the time of receiving the service if a change of address prior to receiving the service was not reported to DHS, Medicare in the reference period or a change of address after receiving the service was reported to DHS, Medicare in the reference period.

Health assessment rebate claims that are not processed within 12 months of the reference period are excluded. This does not significantly affect the data.

Clients are counted once only in the reference period.

Data do not include:

- · health assessment activity for which practitioners do not claim the rebate
- services that qualify under the DVA National Treatment Account and services provided in public hospitals

Data have not been adjusted to account for known under-identification of Indigenous status in MBS data.

Non-Indigenous population estimates are available for census years only. For inter-censal years, experimental estimates and projections data for the Indigenous population are derived using various assumptions. These can be used to derive denominators for calculating non-Indigenous rates for the inter censal years. However, such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

Coherence

The following changes to MBS items occurred on 1 May 2010, but are unlikely to impact time-series analysis. As of 1 May 2010:

- MBS Items 704, 706, 708, 710 (age based Health Assessments for Aboriginal and Torres Strait Islander People) have been replaced with one MBS Item that covers Health Assessments for Aboriginal and Torres Strait Islander People of all ages (Item 715)
- MBS Items 700 and 702 (Health assessments for older people) have been replaced
 with four new MBS items that cover Health assessments for all ages and are based
 on time and complexity of the visit Items 701 (brief), 703 (standard), 705 (long)
 and 707 (prolonged).

For services provided from 1 May 2010, disaggregation by age is based on client date of birth in DHS, Medicare records at the date the service was received.

Health assessments for people who are refugees or humanitarian entrants can also be claimed from 1 May 2010 under MBS Items 701, 703, 705 and 707. This is likely to have little impact on the totals reported as the usage rates for these health assessments are low to extremely low.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm_id=9.

Interpretability

General practice statistics, including explanatory notes, are published at www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

- Data do not include health assessments conducted outside the MBS, for example, in some Aboriginal and Torres Strait Islander community health services. Accordingly, the indicator understates developmental health check activity.
- No adjustment was made to this indicator to account for under-identification of Indigenous people in DHS, Medicare data.

Proportion of children receiving a fourth year developmental health check

Data quality information for this indicator has been prepared based on the Steering Committee's 2012 report to the COAG Reform Council on the National Healthcare Agreement (data supplied by the AIHW) with additional Steering Committee comments.

Indicator definition and description

Element Equity — access

Indicator Developmental health checks.

Measure/s (computation)

Proportion of children who have received a 4 year old development health check.

Numerator: The number of people aged 3, 4 or 5 years with an MBS claim for Items 709, 711, 701, 703, 705, 707 and 10 986 (Healthy Kids Check or Health Assessment) or 708 and 715 (Aboriginal and Torres Strait Islander Peoples Health Assessment) in the

reference period.

Denominator: The population aged 4 years, estimated using ERP data from the ABS. It was calculated by multiplying the 0-4 years ERP disaggregated by Indigenous status by

the percentage of children aged 4 years in this age group nationally.

Calculation: 100 × (Numerator ÷ Denominator), presented as a percentage.

Data source/s

Numerator: Australian Government Department of Human Services (DHS), Medicare Statistics data.

Denominator: For total population: 2011 census based Australian Bureau of Statistics (ABS) Estimated Resident Population (ERP) as at 31 December of the reference year.

For data by Indigenous status: 2011 census based ABS Indigenous Experimental Estimates and Projections (Indigenous Population) Series B as at 31 December derived by averaging the 30 June populations preceding and at the end of the reference year.

Data Quality Framework Dimensions

Institutional environment

DHS, Medicare processes claims made through the MBS under the *Human Services* (*Medicare*) *Act 1973*. These data are then regularly provided to Australian Government Department of Health.

Data for 2009-10 and 2010-11 were calculated by Australian Government Department of Health, using a denominator supplied by the AIHW. Australian Government Department of Health drafted the initial data quality statement (including providing input about the methodology used to extract the data and any data anomalies) and then further comments were added by the AIHW, in consultation with Australian Government Department of Health.

Data from 2011-12 are calculated by the Secretariat using numerator data supplied by Australian Government Department of Health and ABS-sourced denominator data.

Relevance

The measure relates to specific identified DHS, Medicare services for which DHS, Medicare has processed a claim.

The MBS items included in this indicator do not cover all developmental health check activity such as that conducted through state and territory early childhood health assessments in preschools and community health centres.

Timeliness

MBS claims data are available within 14 days of the end of a month. The indicator relates to all claims processed in the reference year.

Accuracy

As with any administrative system a small degree of error may be present in the data captured.

Analyses by state/territory are based on postcode of residence of the client as recorded by DHS, Medicare at the date the last service was received in the reference period. This postcode may not reflect the current postcode of the patient if an address change has not been notified to DHS, Medicare.

Data to 2010-11 are based on the date the claim was processed. From 2011-12, data are based on the date the service was rendered. From 2012 13, data include only services for which rebates were claimed in the reference year. This has minimal impact on the data.

Children who received more than one type of health check are counted once only in the calculations for this indicator. Where a child received both a healthy kids check and an Aboriginal and Torres Strait Islander people's health assessment during the reference period, the child was counted once against the Aboriginal and Torres Strait Islander health assessment.

From 2011-12, children are counted only if they have not received a fourth year developmental health check in a previous reference period at the age of 3, 4 or 5 years.

MBS data presented for Aboriginal and Torres Strait Islander Peoples Health Assessments have not been adjusted to account for known under identification of Indigenous status.

Cells have been suppressed where the numerator is less than 10 for confidentiality reasons and where rates are highly volatile (for example, the denominator is very small) or data are known to be of insufficient quality (for example, where Indigenous identification rates are low).

Non-Indigenous population estimates are available for census years only. For inter-censal years, experimental estimates and projections data for the Indigenous population are derived using various assumptions. These can be used to derive denominators for calculating non-Indigenous rates for the inter censal years. However, such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

Coherence

As of 1 May 2010, the following changes to MBS items occurred:

The Healthy Kids Check Item 709 was replaced with four MBS health assessment items (based on time and complexity) that cover all ages — Items 701 (brief), 703 (standard), 705 (long) and 707 (prolonged). This renders it possible that health assessments for refugees and humanitarian entrants and for people with an intellectual disability (previously claimed under items 714, 718 or 719 and now claimed under the new MBS health assessment items) have been counted. This is likely to have little impact on the totals reported as the usage rates for these health assessments are low to extremely low for children aged 3–5 years.

A Healthy Kids Check provided by a practice nurse or a registered Aboriginal health worker on behalf of a medical practitioner (previously item 711) was replaced with MBS item number 10 986. The change to the MBS item number does not impact time series analysis.

The Aboriginal and Torres Strait Islander Child Health Check (previously item 708) was replaced by the Aboriginal and Torres Strait Islander People's Health Assessment (715) that has no designated time or complexity requirements and covers all ages. The change to the MBS item number does not impact time series analysis.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm_id=9.

Interpretability

General practice statistics, including explanatory notes, are published at www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

- Data do not include developmental health check activity conducted outside the MBS, for example, in preschools and community health centres. Accordingly, the indicator understates developmental health check activity.
- No adjustment was made to this indicator to account for under-identification of Indigenous children in DHS, Medicare data.

Effectiveness of access to GPs

Measure 1: Bulk billing rates

Data quality information has been developed for this measure by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Effectiveness of access to GPs

Measure/s (computation)

Bulk billing rates

Definition: The number of non-referred attendances to GPs that were bulk billed as a

proportion of all non-referred attendances to GPs.

Numerator: The number of non-referred attendances to GPs that were bulk billed.

Denominator: The number of non-referred attendances to GPs.

Computation: Expressed as a percentage.

Disaggregations:

State/Territory by age

Region by age

Data source/s

Numerator: Australian Government Department of Human Services (DHS), Medicare

data.

Denominator: Australian Government Department of Human Services (DHS), Medicare

data.

Data Quality Framework Dimensions

Institutional environment

MBS claims data are an administrative by-product of the DHS, Medicare fee-for-service payment systems. DHS, Medicare collects MBS data under the *Human Services*

(Medicare) Act 1973 and regularly provides the data to DoHA.

Relevance

These measures relate to DHS, Medicare services that are provided by GPs, who are identified through a Major Specialty Algorithm, and for which claims data are available.

Disaggregation by region:

Disaggregation by region is based on the ABS Australian Statistical Geography

Standard 2011 (ASGS) classification.

Timeliness

MBS claims data are available within 14 days of the end of a month.

Accuracy

As with any administrative system a small degree of error may be present in the data

captured.

Allocation to jurisdiction/region: DHS, Medicare claims data used for statistical purposes are based on enrolment postcode of the client at time of processing the final claim in the reference period. This postcode may not be current if the client changed address but did

not notify DHS, Medicare.

Allocation to age group: Allocation to age group is based on client date of birth in DHS, Medicare records at the date the service was received. Where client age is unknown,

attendances are included in totals.

Allocation to reference period: Data include all claims processed in the reference period. Data are based on the date on which the MBS claim was processed by DHS, Medicare, not the date on which the service was rendered. The use of data based on when the claim was processed rather than when the service was rendered produces little difference in the total number of services included in the numerator for the reference

period.

Coherence

Estimates are compiled the same way across jurisdictions and over time.

A revised Major Specialty Algorithm is used to identify GPs. Historical data have been revised and so there is coherence over time in the data presented in this Report. However, data are not comparable with data in previous editions of the report for which a different Major Specialty Algorithm methodology was used.

Accessibility Information is available for MBS Claims data from http://www.humanservices.gov.au/

corporate/statistical-information-and-data/?utm id=9.

Interpretability General practice statistics, including explanatory notes, are published at

www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

• Data are of acceptable accuracy.

Measure 2: People deferring visits to GPs due to financial barriers

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Effectiveness of access to GPs

Measure/s (computation)

People deferring access to GPs due to cost.

Definition: Proportion of people that required GP treatment but deferred that treatment

due to cost.

Numerator: People reporting delaying/not seeing a GP in the last 12 months due to cost.

Denominator: People aged 15 years or over who needed to see a GP in the last

12 months.

Computation: 100 × (Numerator ÷ Denominator).

Data source/s

ABS Patient Experience Survey

Data Quality Framework Dimensions

Institutional environment

Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website at www.abs.gov.au.

Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975.

Data Compiler(s): Data are compiled by the Health section of the ABS.

Statistical confidentiality is guaranteed under the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. The ABS notifies the public through a note on the website when an error in data has been identified. The data are withdrawn, and the publication is re released with the correct data. Key users are also notified where possible.

Relevance

Level of Geography: Data are available by State/Territory, and by Remoteness (major cities, inner and outer regional, remote and, from 2011-12, very remote Australia).

Data Completeness: All data are available for this measure from this source.

Indigenous Statistics: Data are not available by Indigenous status for this measure. The 2012-13 National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) collected data on GP waiting times but differences in survey design and collection methodology between the Patient Experience survey and the NATSIHS mean the data are not comparable.

Numerator/Denominator Source: Same data source.

Data for this indicator were collected for all people aged 15 years or over in Australia, excluding the following:

- · members of the Australian permanent defence forces
- diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts
- · overseas residents in Australia
- members of non-Australian defence forces (and their dependents)

- people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons
- · people living in discrete Indigenous communities.

From 2011-12, the Patient Experience survey included households in very remote areas (although discrete Indigenous communities were still excluded). The inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the NT. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas. The exclusion of persons living in discrete Aboriginal and Torres Strait Islander communities has a small impact on estimates, except for the NT, where such persons make up more than 20 per cent of the population.

Data were self-reported for this indicator.

Timeliness

Collection interval/s: Patient Experience data are collected annually.

Data available: The data used for this indicator became available 22 November 2013 for 2012-13, 28 November 2014 for 2013-14 and 13 November 2015 for 2014-15.

Referenced Period: July 2014 to June 2015 (2014-15 data); July 2013 to June 2014 (2013-14 data); July 2012 to June 2013 (2012-13 data).

There are not likely to be revisions to these data after their release.

Accuracy

Method of Collection: Data were collected by computer assisted telephone interview for all iterations of the Patient Experience Survey. Data from an additional sample for the 2013-14 Patient Experience Survey were predominantly collected face-to-face (see below for more information).

Data Adjustments: Data were weighted to represent the total in scope Australian population, and were adjusted to account for confidentiality and non-response.

Sample/Collection size: The sample for the 2014-15 survey was 27 341 fully-responding persons.

Response rate: Response rate for the 2014-15 survey was 73 per cent.

As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95% confidence intervals. Estimates with a relative standard error between 25% and 50% should be used with caution, and estimates with a relative standard error over 50% are considered too unreliable for general use.

This indicator generally has acceptable levels of sampling error and provides reliable data for most breakdowns. However, RSEs for the waiting time category '4 hours or more but within 24 hours' breakdowns are mostly greater than 25% and should either be used with caution or are considered too unreliable for general use. Similarly, data for the 'other' remoteness category has high RSEs when cross classified by State. Caution should be used when interpreting these data.

Confidentiality:

From 2013-14, the data has been perturbed. This has been footnoted in the tables. Perturbation is used to minimise the risk of identifying individuals in aggregate statistics. Perturbation involves small random adjustment of the statistics and is considered the most satisfactory technique for avoiding the release of identifiable statistics while maximising the range of information that can be released. These adjustments have a negligible impact on the underlying pattern of the statistics.

After perturbation, a given published cell value will be consistent across all tables. However, adding up cell values to derive a total will not necessarily give the same result as published totals.

Data were self-reported but not attitudinal.

Explanatory footnotes are provided for each table. The data for this indicator is self-reported but not attitudinal, as respondents are reporting their experiences of using the health system.

Data is used from personal interviews only (i.e. excluding proxy interviews).

Explanatory footnotes are provided for each table.

Information specific to the 2013-14 and preceding Patient Experience Surveys:

Method of Collection: For this iteration of the Patient Experience Survey, an additional sample was selected in particular areas using a separate survey called the Health Services Survey (HSS). The HSS collected the same information as the Patient Experience Survey, with enumeration taking place between September 2013 and December 2013. The additional sample was collected to improve the quality of estimates at the Medicare Local catchment level. Sample from the Patient Experience Survey and HSS were combined to produce output.

The data was predominantly collected by computer assisted telephone interview, although the HSS interviews were predominantly conducted face-to-face. MPHS PEx included one person aged 15 years and over from each household, while the HSS included two persons aged 15 and over from each household.

Analysis was conducted to determine whether there was any difference between the estimates which would have been obtained using the MPHS PEx sample only and estimates obtained using the combined MPHS PEx and HSS sample. This was particularly important given the predominantly different modes used between the two surveys (The majority of MPHS PEx interviews were conducted over the telephone while a larger proportion of HSS interviews were conducted face-to-face and included up to two persons per household). This analysis showed that combining the sample from the two surveys did not produce significantly different estimates. Therefore, estimates can be compared over time with other iterations of the Patient Experience Survey.

Response rate and sample size: The response rate in 2013-14 to the MPHS PEx was 77% (27,327 fully responding persons) while the response rate to HSS was 83% (8,541 fully responding persons) resulting in a total sample size of 35,868 fully responding persons. This included 629 proxy interviews for people aged 15 to 17 where permission was not given by a parent or guardian for a personal interview.

Note this is a substantial increase from the 2012-13 sample size of 30,749, which had a response rate 78.9 per cent. This increase will improve the reliability of the data, particularly at finer levels of disaggregation.

Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Data for MPHS PEx and HSS were weighted separately and then combined to produce output.

Coherence

2009 was the first year data was collected for this indicator. Questions relating to this indicator were also asked in 2010-11, 2011-12, 2012-13 and 2013-14.

Consistency over time: Data for 2014-15 are comparable to data for 2013-14 and 2012-13 but not to data for previous years, due to a change in question ordering in 2012-13 which had a noticeable context effect. As a result, ABS recommends that this data item is not comparable over time. This has been footnoted in the relevant tables.

Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other.

The numerator and denominator are compiled from a single source.

Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete Indigenous communities in all surveys, and of very remote communities in surveys for 2010-11 and previous years, will affect the NT more than it affects other jurisdictions (people usually resident in such areas account for more than 20 per cent of people in the NT).

Jurisdiction/Australia estimate calculation: All estimates are compiled the same way.

Collections across populations: Data is collected the same way across all jurisdictions.

The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources.

Due to differences in survey scope, collection methodology and question wording, these

data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).

Accessibility

Data publicly available. Tables showing patients experiences with health professionals are available in Health Services: Patient Experiences in Australia, 2009 (cat. no. 4839.0.55.001), Patient Experiences in Australia: Summary of Findings, 2010-11, Patient Experiences in Australia: Summary of Findings, 2011-12, Patient Experiences in Australia: Summary of Findings, 2012-13, Patient Experiences in Australia: Summary of Findings, 2013-14 and Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

The data is shown by age, sex, remoteness and SEIFA. Jurisdictional data is not currently publicly available but may be made available in the future.

Data is not available prior to public access.

Supplementary data is available. Additional data from the Patient Experience Survey is available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Accessibility

Data are publicly available in *Health Services: Patient Experiences in Australia, 2009* (Cat. no. 4839.0.55.001), *Patient Experiences in Australia: Summary of Findings, 2010-11, 2011-12, 2012-13, 2013-14* and *2014-15* (Cat. no. 4839.0).

Data are not available prior to public access.

Supplementary data are available. Additional data from the Patient Experience Survey are available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Interpretability

Context: The data were collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data were collected over a twelve month period which should minimise any seasonality effects in the data.

The 2014-15 ABS Patient Experience data are published in *Patient Experiences in Australia: Summary of Findings*, 2014-15 (Cat. no. 4839.0). The publication includes explanatory and technical notes.

Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in the publication.

Data Gaps/Issues Analysis

Key data gaps /issues

- The inclusion of very remote areas from the 2011-12 survey improves the comparability of NT data, although the exclusion of discrete Indigenous communities will affect the NT more than it affects other jurisdictions.
- Data from the Patient Experience survey are not comparable with data from the 2012-13 NATSIHS. Disaggregation of this indicator by Indigenous status is a priority.

Measure 3: GP Waiting times

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Effectiveness of access to GPs

Measure/s (computation)

GP Waiting Times

Definition

Length of time a patient needs to wait to see a GP for an urgent appointment.

Numerator

Number of people aged 15 years or over who reported seeing a GP for urgent medical care (for their own health) within specified waiting time categories (less than 4 hours, 4 to less than 24 hours, 24 hours or more).

Donominator

Number of people aged 15 years or over who saw a GP for urgent medical care (for their own health) in the last 12 months.

Computation: 100 × (Numerator ÷ Denominator).

Data source/s Patient Experience Survey, ABS.

Data Quality Framework Dimensions

Institutional environment

Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website at www.abs.gov.au.

Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975.

Data Compiler(s): Data are compiled by the Health section of the ABS.

Statistical confidentiality is guaranteed under the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. The ABS notifies the public through a note on the website when an error in data has been identified. The data are withdrawn, and the publication is re released with the correct data. Key users are also notified where possible.

Relevance

Level of Geography: Data are available by State/Territory, and by Remoteness (major cities, inner and outer regional, remote and, from 2011-12, very remote Australia).

Data Completeness: All data are available for this measure from this source.

Indigenous Statistics: Data are not available by Indigenous status for this measure. The 2012-13 National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) collected data on GP waiting times but differences in survey design and collection methodology between the Patient Experience survey and the NATSIHS mean the data are not comparable.

Numerator/Denominator Source: Same data source.

Data for this indicator were collected for all people aged 15 years or over in Australia, excluding the following:

- members of the Australian permanent defence forces
- diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts
- · overseas residents in Australia
- members of non-Australian defence forces (and their dependents)
- people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons
- people living in discrete Indigenous communities.

From 2011-12, the Patient Experience survey included households in very remote areas (although discrete Indigenous communities were still excluded). The inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the NT. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas. The exclusion of discrete Indigenous communities affects the NT more than other jurisdictions as more than 20 per cent of the population of the NT live in such communities.

Data were self-reported for this indicator. The definition of 'urgent medical care' was left up to the respondent, although discretionary interviewer advice was to include health issues that arose suddenly and were serious (e.g. fever, headache, vomiting, unexplained rash), and that seeing a GP to get a medical certificate for work for a less serious illness would not be considered urgent.

Timeliness

Collection interval/s: Patient Experience data are collected annually.

Data available: The data used for this indicator became available 22 November 2013 for 2012-13, 28 November 2014 for 2013-14 and 13 November 2015 for 2014-15.

Referenced Period: July 2014 to June 2015 (2014-15 data); July 2013 to June 2014 (2013-14 data); July 2012 to June 2013 (2012-13 data).

There are not likely to be revisions to these data after their release.

Accuracy

Method of Collection: Data were collected by computer assisted telephone interview for all iterations of the Patient Experience Survey. Data from an additional sample for the 2013-14 Patient Experience Survey were predominantly collected face-to-face (see below for more information).

Data Adjustments: Data were weighted to represent the total in scope Australian population, and were adjusted to account for confidentiality and non-response.

Sample/Collection size: The sample for the 2014-15 survey was 27 341 fully-responding persons.

Response rate: Response rate for the 2014-15 survey was 73 per cent.

As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95% confidence intervals. Estimates with a relative standard error between 25% and 50% should be used with caution, and estimates with a relative standard error over 50% are considered too unreliable for general use.

This indicator generally has acceptable levels of sampling error and provides reliable

data for most breakdowns. However, RSEs for the waiting time category '4 hours or more but within 24 hours' breakdowns are mostly greater than 25% and should either be used with caution or are considered too unreliable for general use. Similarly, data for the 'other' remoteness category has high RSEs when cross classified by State. Caution should be used when interpreting these data.

Confidentiality:

From 2013-14, the data has been perturbed. This has been footnoted in the tables. Perturbation is used to minimise the risk of identifying individuals in aggregate statistics. Perturbation involves small random adjustment of the statistics and is considered the most satisfactory technique for avoiding the release of identifiable statistics while maximising the range of information that can be released. These adjustments have a negligible impact on the underlying pattern of the statistics.

After perturbation, a given published cell value will be consistent across all tables. However, adding up cell values to derive a total will not necessarily give the same result as published totals.

Data were self-reported but not attitudinal, as respondents are reporting their experiences of using the health system (in this instance, the time they waited between making an appointment for urgent medical care and the time they got to see the GP).

Explanatory footnotes are provided for each table. The data for this indicator is self-reported but not attitudinal, as respondents are reporting their experiences of using the health system.

Data is used from personal interviews only (i.e. excluding proxy interviews).

Explanatory footnotes are provided for each table.

<u>Information specific to the 2013-14 and preceding Patient Experience Surveys:</u>

Method of Collection: For this iteration of the Patient Experience Survey, an additional sample was selected in particular areas using a separate survey called the Health Services Survey (HSS). The HSS collected the same information as the Patient Experience Survey, with enumeration taking place between September 2013 and December 2013. The additional sample was collected to improve the quality of estimates at the Medicare Local catchment level. Sample from the Patient Experience Survey and HSS were combined to produce output.

The data was predominantly collected by computer assisted telephone interview, although the HSS interviews were predominantly conducted face-to-face. MPHS PEx included one person aged 15 years and over from each household, while the HSS included two persons aged 15 and over from each household.

Analysis was conducted to determine whether there was any difference between the estimates which would have been obtained using the MPHS PEx sample only and estimates obtained using the combined MPHS PEx and HSS sample. This was particularly important given the predominantly different modes used between the two surveys (The majority of MPHS PEx interviews were conducted over the telephone while a larger proportion of HSS interviews were conducted face-to-face and included up to two persons per household). This analysis showed that combining the sample from the two surveys did not produce significantly different estimates. Therefore, estimates can be compared over time with other iterations of the Patient Experience Survey.

Response rate and sample size: The response rate in 2013-14 to the MPHS PEx was 77% (27,327 fully responding persons) while the response rate to HSS was 83% (8,541 fully responding persons) resulting in a total sample size of 35,868 fully responding persons. This included 629 proxy interviews for people aged 15 to 17 where permission was not given by a parent or guardian for a personal interview.

Note this is a substantial increase from the 2012-13 sample size of 30,749, which had a response rate 78.9 per cent. This increase will improve the reliability of the data, particularly at finer levels of disaggregation.

Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Data for MPHS PEx and HSS were weighted separately and then combined to produce output.

Coherence

Consistency over time: 2009 was the first year data was collected for this indicator. Questions relating to this indicator were also asked in 2010-11, 2011-12, 2012-13, 2013-14 and 2014-15.

Time series issues: 2014-15 is comparable to 2013-14, 2012-13 and 2011-12, but not to previous years. This has been footnoted in the relevant tables. The reason for the comparability issues stem from a significant change in question wording and coding methodology in the 2011-12 Patient Experience Survey for the 'waiting times for GPs' questions, and this has had an impact on the data.

Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other.

The numerator and denominator are compiled from a single source.

Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete indigenous communities in the sample will affect the NT more than it affects other jurisdictions.

Jurisdiction/Australia estimate calculation: All estimates are compiled the same way.

Collections across populations: Data is collected the same way across all jurisdictions.

The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources.

Due to differences in survey scope, collection methodology and question wording, these data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).

Accessibility

Data publicly available. Tables showing patients experiences with health professionals are available in Health Services: Patient Experiences in Australia, 2009 (cat. no. 4839.0.55.001), Patient Experiences in Australia: Summary of Findings, 2010-11, Patient Experiences in Australia: Summary of Findings, 2011-12, Patient Experiences in Australia: Summary of Findings, 2012-13, Patient Experiences in Australia: Summary of Findings, 2013-14 and Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

The data is shown by age, sex, remoteness and SEIFA. Jurisdictional data is not currently publicly available but may be made available in the future.

Data is not available prior to public access.

Supplementary data is available. Additional data from the Patient Experience Survey is available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Accessibility

Data are publicly available in *Health Services: Patient Experiences in Australia, 2009* (Cat. no. 4839.0.55.001), *Patient Experiences in Australia: Summary of Findings, 2010-11, 2011-12, 2012-13, 2013-14* and *2014-15* (Cat. no. 4839.0).

Data are not available prior to public access.

Supplementary data are available. Additional data from the Patient Experience Survey are available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Interpretability

Context: The data were collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data were collected over a twelve month period which should minimise any seasonality effects in the data.

The 2014-15 ABS Patient Experience data are published in *Patient Experiences in Australia: Summary of Findings*, 2014-15 (Cat. no. 4839.0). The publication includes explanatory and technical notes.

Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in the publication.

Data Gaps/Issues Analysis

Key data gaps /issues

- Data for 2011-12, 2012-13, 2013-14 and 2014-15 are comparable.
- The inclusion of very remote areas from the 2011-12 survey improves the comparability of NT data, although the exclusion of discrete Indigenous communities will affect the NT more than it affects other jurisdictions.
- Data are based on waiting times for self-defined urgent medical care.
- Disaggregation of this measure by Indigenous status is a priority.
- The sample size increase from 30 749 in 2012-13 to 35 868 in 2013-14 strengthens reliability of the population level estimates.

Measure 4: Selected potentially avoidable GP-type presentations to emergency departments

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element

Effectiveness — access

Indicator

Attendances at public hospital emergency departments that could have potentially been avoided through the provision of appropriate non-hospital services in the community.

Measure/s (computation)

The number of presentations to public hospital emergency departments in hospitals that reported to the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) where:

- there was a type of visit of Emergency presentation
- a triage category of 4 or 5 was allocated
- the patient did not arrive by ambulance or police or correctional vehicle; and
- the patient was not admitted to the hospital, was not referred to another hospital, and did not die.

Data source/s

This indicator is calculated using data from the NNAPEDCD NMDS.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act* 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

- www.aihw.gov.au/nhissc/
- http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and

public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care (including waiting times for care) for non-admitted patients registered for care in emergency departments in public hospitals.

From 2013-14 the scope of the NNAPEDCD is patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas
- ability to provide resuscitation, stabilisation and initial management of all emergencies
- availability of medical staff in the hospital 24 hours a day
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

The data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

The definition of potentially avoidable GP type presentations is an interim measure, based on data available in the NNAPEDCD. The AIHW is managing revision work for this indicator under the auspices of the Australian Health Ministers' Advisory Council.

Timeliness

The reference period for these data is 2013-14 and 2014-15.

Accuracy

For 2013-14 and 2014-15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Comparability across jurisdictions may be impacted by variation in the assignment of triage categories.

Coherence

Data are not comparable with data presented for 2013-14 and previous years in previous editions of the Report due to expansion of the scope for reportin to the NNAPEDCD. The scope was previously limited to public hospitals in Peer Groups A and B, using the peer group classification method as reported in Australian hospital statistics 2010–11, with the addition of emergency department activity at the Mersey Community Hospital.

In addition, the data reported to the NNAPEDCD in previous years has been consistent with the numbers of emergency occasions of services reported to the NPHED for each hospital for the same reference year.

Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.

The information presented for this indicator is calculated using the same methodology as data published in Australian hospital statistics: emergency department care 2014-15.

Accessibility

The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: Australian hospital statistics suite of products with associated Excel tables. These products may be accessed on the AIHW website at www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the NAPEDC NMDS and the NAPEDC DSS are published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.

The *National health data dictionary* can be accessed online at www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the 2014-15 NNAPEDCD can be accessed on the AIHW website at http://meteor.aihw.gov.au/content/index.phtml/itemId/546749

Data Gaps/Issues Analysis

Key data gaps /issues

- The scope of the data used to produce this indicator is non-admitted patients registered for care in emergency departments in public hospitals reporting to the NNAPEDCD. It does not include emergency presentations to hospitals that have emergency departments that do not meet the criteria specified in the NAPEDC NMDS
- The definition of potentially avoidable GP type presentations is an interim measure, based on data available in the NNAPEDCD. The AlHW is managing revision work for this indicator under the auspices of the Australian Health Ministers' Advisory Council
- In previous reports, the scope of the data used to produce this indicator was non-admitted patients registered for care in emergency departments in public hospitals classified as either peer group A (Principal referral and Specialist women's and children's hospitals) or peer group b (Large hospitals). The scope of data provided for this indicator has changed, therefore data provided in this report are not directly comparable to data calculated in previous reporting periods.

Financial barriers to PBS medicines

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Financial barriers to PBS medicines

Measure/s (computation)

People deferring purchase of prescribed medicines due to cost.

Definition: Proportion of people that deferred purchase of prescribed medicines due to

cost.

Numerator: Number of people who reported delaying or not getting a prescription filled

for medication in the last 12 months because of cost.

Denominator: Total number of people aged 15 years or over who received a prescription

for medication from a GP in the last 12 months.

Computation: 100 × (Numerator ÷ Denominator).

Data source/s ABS Patient Experience Survey

Data Quality Framework Dimensions

Institutional environment

Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website at www.abs.gov.au.

Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975.

Data Compiler(s): Data are compiled by the Health section of the ABS.

Statistical confidentiality is guaranteed under the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. The ABS notifies the public through a note on the website when an error in data has been identified. The data are withdrawn, and the publication is re released with the correct data. Key users are also notified where possible.

Relevance

Level of Geography: Data are available by State/Territory, and by Remoteness (major cities, inner and outer regional, remote and, from 2011-12, very remote Australia).

Data Completeness: All data are available for this measure from this source.

Indigenous Statistics: Data are not available by Indigenous status for this measure. The 2012-13 National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) collected data on GP waiting times but differences in survey design and collection methodology between the Patient Experience survey and the NATSIHS mean the data are not comparable.

Numerator/Denominator Source: Same data source.

Relevance (cont.)

Data for this indicator were collected for all people aged 15 years or over in Australia, excluding the following:

- · members of the Australian permanent defence forces
- diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts
- · overseas residents in Australia
- members of non-Australian defence forces (and their dependents)
- people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons
- · people living in discrete Indigenous communities.

From 2011-12, the Patient Experience survey included households in very remote areas (although discrete Indigenous communities were still excluded). The inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the NT. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas. The exclusion of persons living in discrete Aboriginal and Torres Strait Islander communities has a small impact on estimates, except for the NT, where such persons make up more than 20 per cent of the population.

Data were self-reported for this indicator.

Timeliness

Collection interval/s: Patient Experience data are collected annually.

Data available: The data used for this indicator became available 22 November 2013 for 2012-13, 28 November 2014 for 2013-14 and 13 November 2015 for 2014-15.

Referenced Period: July 2014 to June 2015 (2014-15 data); July 2013 to June 2014 (2013-14 data); July 2012 to June 2013 (2012-13 data).

There are not likely to be revisions to these data after their release.

Accuracy

Method of Collection: Data were collected by computer assisted telephone interview for all iterations of the Patient Experience Survey. Data from an additional sample for the 2013-14 Patient Experience Survey were predominantly collected face-to-face (see below for more information).

Data Adjustments: Data were weighted to represent the total in scope Australian population, and were adjusted to account for confidentiality and non-response.

Sample/Collection size: The sample for the 2014-15 survey was 27 341 fully-responding persons.

Response rate: Response rate for the 2014-15 survey was 73 per cent.

As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95% confidence intervals. Estimates with a relative standard error between 25% and 50% should be used with caution, and estimates with a relative standard error over 50% are considered too unreliable for general use.

This indicator generally has acceptable levels of sampling error and provides reliable data for most breakdowns. However, RSEs for the waiting time category '4 hours or more but within 24 hours' breakdowns are mostly greater than 25% and should either be used with caution or are considered too unreliable for general use. Similarly, data for the 'other' remoteness category has high RSEs when cross classified by State. Caution should be used when interpreting these data.

Confidentiality:

From 2013-14, the data has been perturbed. This has been footnoted in the tables. Perturbation is used to minimise the risk of identifying individuals in aggregate statistics. Perturbation involves small random adjustment of the statistics and is considered the most satisfactory technique for avoiding the release of identifiable statistics while maximising the range of information that can be released. These adjustments have a negligible impact on the underlying pattern of the statistics.

After perturbation, a given published cell value will be consistent across all tables. However, adding up cell values to derive a total will not necessarily give the same result as published totals.

Data were self-reported but not attitudinal, as respondents are reporting their experiences of using the health system (in this instance, the time they waited between making an appointment for urgent medical care and the time they got to see the GP).

Explanatory footnotes are provided for each table. The data for this indicator is self-reported but not attitudinal, as respondents are reporting their experiences of using the health system.

Data is used from personal interviews only (i.e. excluding proxy interviews).

Explanatory footnotes are provided for each table.

Information specific to the 2013-14 and preceding Patient Experience Surveys:

Method of Collection: For this iteration of the Patient Experience Survey, an additional sample was selected in particular areas using a separate survey called the Health Services Survey (HSS). The HSS collected the same information as the Patient Experience Survey, with enumeration taking place between September 2013 and December 2013. The additional sample was collected to improve the quality of estimates at the Medicare Local catchment level. Sample from the Patient Experience Survey and HSS were combined to produce output.

The data was predominantly collected by computer assisted telephone interview, although the HSS interviews were predominantly conducted face-to-face. MPHS PEx included one person aged 15 years and over from each household, while the HSS included two persons aged 15 and over from each household.

Analysis was conducted to determine whether there was any difference between the estimates which would have been obtained using the MPHS PEx sample only and estimates obtained using the combined MPHS PEx and HSS sample. This was particularly important given the predominantly different modes used between the two surveys (The majority of MPHS PEx interviews were conducted over the telephone while a larger proportion of HSS interviews were conducted face-to-face and included up to two persons per household). This analysis showed that combining the sample from the two surveys did not produce significantly different estimates. Therefore, estimates can be compared over time with other iterations of the Patient Experience Survey.

Response rate and sample size: The response rate in 2013-14 to the MPHS PEx was 77% (27,327 fully responding persons) while the response rate to HSS was 83% (8,541 fully responding persons) resulting in a total sample size of 35,868 fully responding persons. This included 629 proxy interviews for people aged 15 to 17 where permission was not given by a parent or guardian for a personal interview.

Note this is a substantial increase from the 2012-13 sample size of 30,749, which had a response rate 78.9 per cent. This increase will improve the reliability of the data, particularly at finer levels of disaggregation.

Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Data for MPHS PEx and HSS were weighted separately and then combined to produce output.

Coherence

2009 was the first year data was collected for this indicator. Questions relating to this indicator were also asked in 2010-11, 2011-12, 2012-13 and 2013-14.

Consistency over time: Data for 2013-14 are comparable to data for 2012-13, 2011-12 and 2010-11, but not before this (ie not comparable to 2009). This is due to changes in question wording/sequencing in the patient experience survey. As a result, a time series can be started from 2010-11 onwards. This has been footnoted in the relevant tables.

Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other.

The numerator and denominator are compiled from a single source.

Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete Indigenous communities in the 2011-12 and 2012-13

32

surveys, and of very remote communities in the previous surveys, will affect the NT more than it affects other jurisdictions (people usually resident in discrete Indigenous communities account for more than 20 per cent of people in the NT).

Jurisdiction/Australia estimate calculation: All estimates are compiled the same way.

Collections across populations: Data is collected the same way across all jurisdictions.

The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources.

Due to differences in survey scope, collection methodology and question wording, these data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).

Accessibility

Data publicly available. Tables showing patients experiences with health professionals are available in Health Services: Patient Experiences in Australia, 2009 (cat. no. 4839.0.55.001), Patient Experiences in Australia: Summary of Findings, 2010-11, Patient Experiences in Australia: Summary of Findings, 2011-12, Patient Experiences in Australia: Summary of Findings, 2012-13, Patient Experiences in Australia: Summary of Findings, 2013-14 and Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

The data is shown by age, sex, remoteness and SEIFA. Jurisdictional data is not currently publicly available but may be made available in the future.

Data is not available prior to public access.

Supplementary data is available. Additional data from the Patient Experience Survey is available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Interpretability

Context: The data were collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data were collected over a twelve month period which should minimise any seasonality effects in the data.

The 2014-15 ABS Patient Experience data are published in *Patient Experiences in Australia: Summary of Findings*, 2014-15 (Cat. no. 4839.0). The publication includes explanatory and technical notes.

Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in the publication.

Data Gaps/Issues Analysis

Key data gaps /issues

- Data from the Patient Experience survey are not comparable with data from the NATSIHS. Disaggregation of this indicator by Indigenous status is a priority.
- The inclusion of very remote areas from the 2011-12 survey improves the comparability of NT data, although the exclusion of discrete Indigenous communities will affect the NT more than it affects other jurisdictions.

Public dentistry waiting times

Data quality information for this measure has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Public dentistry waiting times.

Measure/s (computation)

Median number of days waited between being placed on a public dentistry waiting list

and:

· receiving dental care, or, if data not available,

· being offered dental care.

Data source/s

Public dental waiting times NMDS 2013-

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

Relevance

The purpose of the PDWT NMDS is to collect information about the length of time that patients wait for public dental care in Australia. The scope of the NMDS is people who received or were offered public dental care, in the reporting period, in Australia.

The data collection excludes people who are treated under jurisdictional priority client schemes, and may also exclude some other people who are not placed on a public dental waiting list. Therefore, the waiting times reported are not the median waiting times experienced by all people aged 18 years or over who received public dental services.

The analyses by remoteness and socioeconomic status are based on the usual residence of the patient. However, data are reported by jurisdiction of receipt of dental care regardless of the jurisdiction of usual residence.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

Accuracy

For 2013–14 and 2014–15, data are published for all jurisdictions except New South Wales and Northern Territory.

Data providers are primarily responsible for the quality of the data they provide. However, the AIHW has undertaken basic validation of the data. The AIHW does not adjust data to account for possible data errors or missing or incorrect values, however, data were excluded from waiting times calculations where:

- the data provided resulted in a negative waiting time, or
- where a record has no date of offer or date of dental care, and so a waiting time could not be calculated.

Waiting times of zero days are included in the analysis.

Only treatments received after a person is removed from a public dental waiting list should be recorded.

Some double counting may occur in this collection due an inability to link cases where:

 a waiting time to being offered dental care was reported for a person in one reference period and then a waiting time till dental care was reported for the same person in the next reference period.

Coherence

2013–14 was the first year of collection of national public dental waiting times data under the agreement to collect PDWT NMDS data.

In relation to the ability to compare data over time, and between jurisdictions:

- New South Wales data were not available for 2013–14 and are not published in 2014–15 due to data quality issues.
- Northern Territory data are not published in 2013–14 or 2014–15 due to data quality issues.
- Data for jurisdictions across years is comparable.
- Data is not comparable across jurisdictions due to differences in the way in which services are arranged and different arrangements that determine which people requiring treatment are placed on a public dental waiting list, including how jurisdictions prioritise certain disadvantaged population groups.
- Waiting times are not shown by waiting list type. Differences in the purpose and processes between different list types limit comparability of waiting times between jurisdictions and over time.

Accessibility

The AIHW will publish data from this collection on the AIHW website at <www.aihw.gov.au>.

Interpretability

Metadata information for the PDWT NMDS is published in the AIHW's Metadata Online Registry (METeOR) and the National health data dictionary.

METeOR and the National health data dictionary can be accessed at the following AIHW web addresses, respectively:

http://meteor.aihw.gov.au/content/index.phtml/itemId/517220

http://www.aihw.gov.au/publication-detail/?id=10737422826.

Data Gaps/Issues Analysis

Key data gaps /issues

- This indicator is being reported for the first time (for 2013–14 and 2014–15) drawing on data collated under an agreement to report against the Public Dental Waiting Times (PDWT) National Minimum Data Set (NMDS).
 - Data are not comparable across jurisdictions due to differences in the way in which services are arranged and different arrangements that determine which people requiring treatment are placed on a public dental waiting list, including how jurisdictions prioritise certain disadvantaged population groups.
 - Data for 2013–14 and 2014–15 do not include New South Wales or Northern Territory, due to data quality concerns.
 - Data for jurisdictions are comparable across years.
 - Waiting times are not shown by waiting list type. Differences in the purpose and processes between different list types limit comparability of waiting times between jurisdictions and over time.
 - Waiting times could not be calculated for some records (including where negative waiting times were reported or where a record had no date of offer or date of dental care).
 - Waiting times of zero days are included in all analyses.
 - The collection excludes people who are treated under jurisdictional priority client schemes.
 - In a small number of cases, double counting of people may occur across these reference years due to an inability to link people across reference years in this collection.

GPs with vocational registration

Data quality information has been developed by the Health Working Group for this indicator with additional Steering Committee comments.

Indicator definition and description

Element Appropriateness

Indicator GPs with vocational registration

Measure/s (computation)

The proportion of general practitioners (GPs) with vocational registration.

Definition: The number of Full Service Equivalent (FSE) vocationally registered GPs

divided by the number of FSE GPs and Other medical practitioners (OMP).

Numerator: Number of FSE vocationally registered GPs.

Denominator: Number of FSE vocationally registered GPs and OMPs.

Computation: 100 x (Numerator ÷ Denominator).

Disaggregations:
• State/Territory
• Region

Data source/s

Australian Government Department of Human Services (DHS), Medicare data.

Data Quality Framework Dimensions

Institutional environment

MBS data are an administrative by-product of the DHS, Medicare fee for-service payment systems. DHS, Medicare collects MBS data under the *Human Services* (*Medicare*) *Act 1973* (previously *Medicare Australia Act 1973*) and regularly provides the data to the Department of Health.

Relevance

Data capture all vocationally registered GPs and OMPs.

A vocationally registered GP is a medical practitioner who is vocationally registered under s.3F of the *Health Insurance Act 1973* (Cwlth), holds Fellowship of the RACGP, ACRRM, or equivalent, or holds a recognised training placement, and who has at least half of the schedule fee value of his/her DHS Medicare billing from non-referred attendances.

An OMP is a medical practitioner other than a vocationally registered GP who has at least half of the schedule fee value of his/her DHS Medicare billing from non-referred attendances.

Allocation of FWE GPs and OMPs to state or territory and region is based on the practice location at which services were rendered within the reference period.

Disaggregation by region is based on the ABS Australian Statistical Geography Standard 2011 (ASGS) classification.

Timeliness

GP FSE figures are available 10 weeks after the close of the reference period.

Accuracy

As with any administrative system a small degree of error may be present in the data captured.

Coherence

Estimates are compiled the same way across jurisdictions and over time.

This is the first year that the FSE estimate of GP workforce is used and historical data have been revised accordingly. Data for 2011-12 and previous years were also revised to use the regional ASGS classification.

Hence, there is coherence over time in data presented in this Report. However, data are not comparable with data in previous editions of the report which used a different methodology (Full-time Work Equivalent) to estimate workforce and a different regional classification system for data for the years to 2011-12.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm_id=9.

Interpretability

General practice statistics, including explanatory notes, are published at www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

 The classification system used to allocate GPs to regions for all years is current, a major improvement over previous reports in which data for 2011-12 and previous years were based on a system developed in 1994.

Management of upper respiratory tract infections

Data quality information has been developed by the Health Working Group for one of the measures for this indicator with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — appropriateness

Indicator Management of upper respiratory tract infections

Measure/s (computation)

Definition: The number of prescriptions for selected antibiotics (those oral antibiotics most commonly prescribed to treat upper respiratory tract infection [URTI]) that are

provided per 1000 people.

Numerator: The number of prescriptions for selected antibiotics (those oral antibiotics

most commonly prescribed to treat URTI) that are provided and dispensed.

Denominator: ERP

Computation: 1000 × (Numerator ÷ Denominator), presented as a rate.

Data source/s

Numerator: Australian Government Department of Health Pharmaceutical Benefits

Scheme (PBS) Statistics data.

Denominator: ABS preliminary ERP based on the 2011 Census at 31 December in the

reference year.

Data Quality Framework Dimensions

Institutional environment

PBS claims data is a record of all dispensed prescriptions subsidised by the Australian Government. The PBS is managed by Australian Government Department of Health and administered by the Department of Human Services (DHS), Medicare. Provisions governing the operation of the PBS are contained in the National Health Act 1953.

The indicator was calculated by the Secretariat using the numerator data supplied by Australian Government Department of Health and ABS ERP.

Relevance

These measures relate to PBS subsidised oral antibiotics used most commonly in treating URTI: phenoxymethylpenicillin (penicillin V); amoxycillin; erythromycin; roxithromycin; cefaclor; amoxycillin+clavulanic acid; doxycycline; clarithromycin; and cefuroxime. All active PBS item codes associated with each of these generic names that were ordered by GPs and dispensed to patients were extracted for each reference period.

These antibiotics are used to treat a range of conditions in addition to URTI. Data disaggregated by the condition being treated are not available. The proportion of these antibiotics prescribed for treatment of URTI is unknown.

Allocation to state or territory is based on the state or territory of the pharmacy supplying the prescription.

Timeliness

PBS claims data are available within three working days of the end of a month.

Accuracy

PBS data from 2012-13 are complete. For previous years, PBS data for general patients was available only for items priced above the PBS general co-payment (\$35.40 in 2012) and therefore, the majority of script data for these patients was missing. Hence, data for 2011-12 and previous years were reported only for concession card holders.

Data include only prescriptions provided by GPs and OMPs.

Coherence

Data are are estimated the same way across jurisdictions.

Data for 2012-13 and subsequent years are not comparable to data for 2011-12 and previous years, which are reported only for concession card holders.

Accessibility

PBS Claims data is available from www.medicareaustralia.gov.au/provider/pbs/stats.jsp.

Interpretability

Information on PBS data is available from www.medicareaustralia.gov.au/provider/pbs/stats.jsp at the PBS item reports and PBS group reports links.

Data Gaps/Issues Analysis

Key data gaps /issues

- URTI is one of a range of conditions for which these antibiotics are prescribed. Data are not able to be disaggregated by condition.
- The availability of complete data on the selected antibiotics dispensed in the general population significantly improves data quality from 2012-13.

Chronic disease management

Management of diabetes — HbA1c level

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — Appropriateness
Indicator Chronic disease management

Management of dispates — Uh Ad

Measure/s (computation)

Management of diabetes — HbA1c.

Numerator: Number of people aged between 18 and 69 years with known diabetes, as determined by a fasting plasma glucose test, who have an HbA1c level of less than or equal to 7.0 per cent.

Denominator: Number of persons aged between 18 and 69 years with known diabetes, as determined by a fasting plasma glucose test.

Computation: 100 × (Numerator ÷ Denominator).

Data source/s

For the 2016 Report, the denominator and numerator for this indicator use data from the 2011-12 National Health Measures Survey (NHMS) component of the Australian Bureau Statistics (ABS) Australian Health Survey (AHS), which is weighted to benchmarks for the total AHS in-scope population derived from the Estimated Resident Population (ERP).

For information on scope and coverage, see the Australian Health Survey: Users' Guide (cat. no. 4363.0.55.001) on the ABS website, www.abs.gov.au.

Data Quality Framework Dimensions

Institutional environment

The 2011-12 NHMS was collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

Relevance

For this measure, the fasting plasma glucose test is used in the determination of people with known diabetes and the HbA1c test is used in the determination of effective management of diabetes.

The 2011-12 NHMS uses a combination of blood test results for fasting plasma glucose and self-reported information on diabetes diagnosis and medication use to measure prevalence of known diabetes.

A respondent to the survey is considered to have known diabetes if they had ever been told by a doctor or nurse that they have diabetes and:

• they were taking diabetes medication (either insulin or tablets)

or

 their blood test result for fasting plasma glucose was greater than or equal to 7.0 mmol/L.

Persons with known diabetes who have an HbA1c result of less than or equal to 7.0 per cent are considered to be managing their diabetes effectively.

The estimates exclude persons who did not fast for 8 hours or more prior to their blood test. Excludes women with gestational diabetes.

Timeliness

The NHMS was conducted for the first time in 2011–13. Results from the 2011-12 NHMS were released in August 2013. Results from the NATSIHMS were released in 2014.

Accuracy

The AHS was conducted in all States and Territories, excluding very remote areas and discrete Aboriginal and Torres Strait Islander communities. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas and discrete Aboriginal and Torres Strait Islander communities has a small impact on estimates, except for the NT, where such persons make up more than 20 per cent of the population. The final response rate for the 'core' component of the AHS was 82 per cent.

All selected persons aged 5 years and over were invited to participate in the voluntary NHMS. Of all of those who took part in the AHS, 38 per cent went on to complete the biomedical component.

Analysis of the sample showed that the characteristics of persons who participated in the NHMS were similar with those for the AHS overall. The only significant difference was for smoking, where the NHMS sample had a lower rate of current smokers than the AHS sample (12.0 per cent compared with 17.6 per cent). For more information, see the Explanatory Notes in Australian Health Survey: Biomedical Results for Chronic Disease (cat. no. 4364.0.55.005).

In order to get an accurate reading for the fasting plasma glucose test, participants were asked to fast for 8 hours before their test. The results presented for this indicator refer only to those people who did fast (approximately 79 per cent of adults who participated in the NHMS). Analysis of the characteristics of people who fasted compared with those who did not fast showed no difference between fasters and non-fasters.

As they are drawn from a sample survey, data for the indicator are subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

This indicator produces high levels of sampling error for some States and Territories when split by sex. Estimates for males and females in Victoria have RSEs greater than 50 per cent and should be considered unreliable for general use. Likewise, estimates for males in the Northern Territory and females in the Australian Capital Territory also have RSEs greater than 50 per cent.

Data for several State and Territories also have RSEs greater than 25 per cent, including the total for Victoria, South Australia, the Australian Capital Territory and the Northern Territory, and these estimates should be used with caution.

Coherence

The AHS collected a range of other health-related information that can be analysed in conjunction with diabetes management.

The 2009-10 Victorian Health Monitor (VHM) reported estimates of diabetes management based on the proportion of people with known diabetes meeting the HbA1c management target of less than or equal to 7.0 nmol/L. The VHM age-standardised rate (39 per cent) was similar to the NHMS rate for Victoria (36 per cent).

Accessibility

See Australian Health Survey: Biomedical Results for Chronic Disease (cat. no. 4364.0.55.005). Other information from this survey is also available on request.

Interpretability

Information to aid interpretation of the data is available from the Australian Health Survey: Users' Guide on the ABS website.

Many health-related issues, including diabetes, are closely associated with age. However, numbers across age ranges were too few to do any meaningful age standardisation at the State/Territory level for this measure. Therefore the data presented are based on crude rates.

Data Gaps/Issues Analysis

Key data gaps /issues

- The 2011-12 National Health Measures Survey (NHMS) was conducted for the first time as part of the 2011-13 Australian Health Survey (AHS), with participation voluntary in the NHMS. Of those who took part in the AHS, 38 per cent took part in the NHMS. The NHMS sample was found to be representative of the AHS population.
- The NHMS does not include people living in very remote areas or discrete Aboriginal and Torres Strait Islander communities, which affects the comparability of data for the NT with data for other jurisdictions.

Measure 2: Management of asthma

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — Appropriateness

Indicator Chronic disease management

Measure/s (computation)

Management of asthma

Definition

• Proportion of people with asthma who have a written asthma action plan.

Numerator

• Estimated number of people with asthma with a written asthma action plan.

Denominator: Estimated number of people with asthma.

Computation: 100 × (Numerator ÷ Denominator).

Data source/s

Data reported for 2011–13 are from the ABS 2011–13 Australian Health Survey (AHS) (2011-12 National Health Survey (NHS) component) and the ABS 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (NATSIHS component). Data reported for 2007-08 are from the ABS 2007-08 NHS. Data reported for 2004-05 are from the ABS 2004-05 NHS and the ABS 2004-05 NATSIHS.

NHS data are weighted to benchmarks for the total NHS in scope population, derived from the ERP. For information on NHS scope and coverage, see ABS Australian Health Survey: Users' Guide (Cat. no. 4363.0.55.001) on the ABS website, www.abs.gov.au.

NATSIHS data are benchmarked to the estimated population of Aboriginal and Torres Strait Islander Australians (adjusted for the scope of the survey).

Data Quality Framework Dimensions

Institutional environment

The NHS and NATSIHS are collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

Relevance

The NHS 2011-12 and 2007-08 asked all respondents whether they had ever been told by a doctor or nurse that they have asthma, whether symptoms were present or they had taken treatment in the 12 months prior to interview, and whether they still had asthma. Those who answered yes to these questions were asked whether they had 'a written asthma action plan, that is, written instructions of what to do if your asthma is worse or out of control'. A very small number of respondents who were sequenced around these questions may have reported current long-term asthma in response to later general questions about medical conditions. These people are included in and contribute to estimates of the prevalence of asthma, but information about written action plans was not collected from them.

In the 2012-13 NATSIHS, non-remote respondents who reported they have been told by a doctor that they have asthma, and who still get asthma or have had symptoms of asthma in the last 12 months were asked about written asthma action plans. In the 2004-05 NATSIHS, non-remote respondents who answered questions about having asthma 'yes' were asked about written asthma action plans.

In both the 2004-05 NHS and NATSIHS, respondents were asked if they had 'a written asthma action plan'. If they queried the interviewer about what to include, they were told to include management plans developed in consultation with a doctor, cards associated with peak flow meters and medication cards distributed through chemists. In 2007, if they queried the interviewer, respondents were asked to include plans that were worked out in consultation with a doctor, but not cards associated with peak flow meters or medications cards handed out by chemists.

Ideally this indicator would relate to the proportion of people with moderate to severe asthma, as people with only very mild asthma are unlikely to require planned care. Consequently, there is no clear direction of improvement in this indicator: a lower proportion of people with asthma with an asthma care plan may simply mean that those people with asthma have less severe asthma (which would actually be a positive outcome).

Timeliness

The NHS is conducted every three years over a 12 month period. Results from the 2011-12 NHS component of the AHS were released in October 2012.

The NATSIHS is conducted every six years. Results from the 2012-13 survey were released in November 2013.

Accuracy

The NHS is conducted in all States and Territories, excluding very remote areas. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of people usually resident in very remote areas has a small impact on estimates, except for the Northern Territory, where such people make up approximately 23 per cent of the population. Results are weighted to account for non-response.

The response rate for the 2011-12 NHS was 85 per cent and for the 2007-08 NHS was 91 per cent.

The NATSIHS is conducted in all States and Territories and includes remote and non-remote areas. The 2012-13 sample was 9317 people/5371 households, with a response rate of 80 per cent. The 200-05 sample was 10 000 people/5200 households, with a response rate of 81 per cent of households. Results are weighted to account for non-response.

As it is drawn from a sample survey, the indicator is subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their Relative Standard Error (RSE). Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use.

Coherence

Questions used in the 2011-12 and 2007-08 NHS to collect data for this indicator are consistent with the questions recommended for use by the Australian Centre for Asthma Monitoring (ACAM). Data for 2011-12 and 2007-08 are comparable over time (except for the Northern Territory) but are not comparable to data from the 2004 05 survey due to better alignment of questions and concepts with the ACAM recommendations since 2004-05.

Data for the NT in 2011-12 are not comparable to previous years due to the increase in sample size in 2011-12.

The NHS and NATSIHS collect a range of other health-related information (for example, information on smoking) that can be analysed in conjunction with data on asthma and asthma plans.

Accessibility

See Australian Health Survey: First Results (Cat. no. 4364.0.55.001) and Australian Health Survey: Health Service Usage and Health Related Actions (Cat. no. 4364.0.55.002) for an overview of results from the NHS component of the AHS. Other information from this survey is also available on request.

See Aboriginal and Torres Strait Islander Health Survey: First Results, Australia, 2012-13 (Cat. no. 4727.0.55.001) for an overview of results from the 2012-13 NATSIHS. Other information from the survey is available on request.

Interpretability

Information to aid interpretation of the data is available from the Australian Health Survey: Users' Guide and the Australian Aboriginal and Torres Strait Islander Health

Survey: Users' Guide on the ABS website.

Many health-related issues are closely associated with age, therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories and the Indigenous and non-Indigenous population. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data provide relevant information on the proportion of asthmatics who have an asthma management plan. However, there is no information about the severity of the condition and people with mild asthma are unlikely to require a written plan.
- NATSIHS data are only collected every six years. An assessment of the relative speed of change in outcomes is required to determine whether more regular data collection is necessary.
- The NHS does not include people living in very remote areas which affects the comparability of the NT results.

Use of pathology tests and diagnostic imaging

Data quality information has been developed for this measure by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — Appropriateness

Indicator Use of pathology tests and diagnostic imaging

Measure 1 MBS items rebated through Department of Human Services (DHS), Medicare for pathology tests requested by general practitioners (GP), and Other Medical Practitioners

(OMP), per person (age-standardised)

Definition: The number of MBS items rebated through DHS, Medicare for pathology

tests requested by specialist GPs and OMPs, per person (age standardised)

Numerator: The number of MBS items rebated through DHS, Medicare for pathology

tests requested by GPs and OMPs

Denominator: Estimated Resident Population (ERP)

Computation: Numerator + Denominator, age-standardised

Measure 2 Diagnostic imaging services provided on referral from specialist GPs and OMPs and

rebated through DHS, Medicare, per person (age standardised)

Definition: The number of MBS items rebated through DHS, Medicare for diagnostic imaging services referred by GPs and OMPs, per person (age standardised)

Numerator: The number of MBS items rebated through DHS, Medicare for diagnostic

imaging services referred by GPs and OMPs

Denominator: Estimated Resident Population (ERP)

Computation: Numerator ÷ Denominator, age-standardised

Measure 3 DHS, Medicare benefits paid per person for pathology tests requested by GPs and

OMPs (age-standardised).

Data are deflated using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) to provide real expenditure, comparable

over time.

Measure 4 DHS, Medicare benefits paid per person for diagnostic imaging referred by GPs and

OMPs (age-standardised).

Data are deflated using the GGFCE chain price deflator (2014-15 = 100) to provide real

expenditure, comparable over time.

Data source/s Numerator:

• For MBS data: DHS, Medicare data.

 For DVA data: Australian Government Department of Veterans' Affairs (DVA) Statistical Services and Nominal Rolls using the Departmental Management Information System (DMIS). These data are known as Treatment Account System

(TAS) data.

Denominator: ABS 2011 Census-based Estimated Resident Population (ERP) as at 31 December in the reference year.

Data Quality Framework Dimensions

Institutional environment

DHS, Medicare processes and collects MBS data for:

- claims made through the MBS under the *Health Insurance Act 1973*. These data are regularly provided to Australian Government Department of Health.
- claims for DVA Treatment Card holders, also made through the MBS, under the Veterans' Entitlements Act 1986; Military Rehabilitation and Compensation Act 2004 and Human Services (Medicare) Act 1973. All claims data are regularly provided to DVA as per the Memorandum of Understanding between DHS, Medicare and DVA.

MBS claims data are an administrative by-product of DHS, Medicare's fee for-service payment systems.

DHS, Medicare and DVA data are provided separately to the Secretariat. The Secretariat collates the data and computes rates.

Relevance

The measure relates to specific identified MBS services for which DHS, Medicare has processed a claim:

- Pathology tests all items in Broad Type of Service (BTOS) 'N' or 'F'.
- Diagnostic imaging services all items in BTOS 'G'.

Claims are allocated to state/territory based on location at which the service was rendered.

Expenditure data reflect only the benefits paid by the Australian Government. Contributions made by insurance companies and/or individuals are excluded.

Timeliness

Data include all claims processed in the reference period.

Accuracy

Data are limited to claims for services requested/referred by GPs and, for MBS data, OMPs (DVA data include only services requested/referred by specialist GPs). Data do not include claims for services requested/referred by other medical specialists.

Data include all claims processed in the reference period.

Pathology tests

The pathology episode cone applies to services requested by general practitioners for non-hospitalised patients:

when more than three MBS pathology items are requested by a GP in a patient episode, the benefits payable will be equivalent to the sum of the benefits for three items — those with the highest schedule fees (there are some items exempted from the episode cone). Where additional tests performed in a patient episode are not rebated through DHS, Medicare, they are not included in the data. This results in some underreporting of the number of pathology tests conducted on request by GPs and OMPs.

Data include Patient Episode Initiated Items.

Diagnostic imaging

Diagnostic imaging services provided and rebated through DHS, Medicare can differ from the services requested by GPs and OMPs.

In certain circumstances, as defined by legislation, a radiologist can identify the need for, and perform, more or different diagnostic imaging services than are requested by a GP/OMP. The data reflect the services provided and rebated through DHS, Medicare, rather than the services requested by GPs/OMPs.

Coherence

Data are compiled the same way across jurisdictions. Rates from 2012-13 are age-standardised to the 2001 Australian Standard Population. These data are not comparable to crude rates reported for previous years.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm id=9.

DVA data are not publically accessible.

Interpretability

General practice statistics, including explanatory notes, are published at www.health.gov.au/internet/main/publishing.nsf/Content/General+Practice+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

- Age-standardisation of rates from 2012-13 is a significant improvement. However, rates are not comparable with crude rates reported for previous years.
- This is a proxy measure data are limited to those services rebated through DHS, Medicare that were provided in response to request/referral by GPs/OMPs.
- Provides information about relative requests/referrals for pathology tests and diagnostic imaging across jurisdictions and over time, but not the appropriateness thereof.

Patient satisfaction

Data quality information for this measure has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Quality — responsiveness

Indicator Patient satisfaction/experience around key aspects of care they received.

Measure/s (computation)

Measure a: people who saw a GP in the last 12 months reporting the GP always or

often: listened carefully, showed respect, and spent enough time with them

Definition: Proportion of people satisfied with selected aspects of GP/dentist care.

Numerator: People who saw a GP/dentist in the last 12 months reporting the GP/dentist always or often: listened carefully; showed respect; spent enough time with them.

Denominator: People who saw a GP/dentist for their own health in the last 12 months, availabling people who were intentioned by providing

excluding people who were interviewed by proxy.

Data source/s

ABS Patient Experience Survey

Data Quality Framework Dimensions

Institutional environment

Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment on the ABS website at www.abs.gov.au.

Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975.

Data Compiler(s): Data are compiled by the Health section of the ABS.

Statistical confidentiality is guaranteed under the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. The ABS notifies the public through a note on the website when an error in data has been identified. The data are withdrawn, and the publication is re released with the correct data. Key users are also notified where possible.

Relevance

Level of Geography: Data are available by State/Territory, and by Remoteness (major cities, inner and outer regional, remote and, from 2011-12, very remote Australia).

Data Completeness: All data are available for this measure from this source.

Indigenous Statistics: Data are not available by Indigenous status for this measure. The 2012-13 National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) collected data on GP waiting times but differences in survey design and collection methodology between the Patient Experience survey and the NATSIHS mean the data are not comparable.

Numerator/Denominator Source: Same data source.

Relevance (cont.)

Data for this indicator were collected for all people aged 15 years or over in Australia, excluding the following:

- members of the Australian permanent defence forces
- diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts
- · overseas residents in Australia
- members of non-Australian defence forces (and their dependents)
- people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons
- · people living in discrete Indigenous communities.

From 2011-12, the Patient Experience survey included households in very remote areas (although discrete Aboriginal and Torres Strait Islander communities were still excluded). Inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the NT. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas. The exclusion of persons usually residing in discrete Aboriginal and Torres Strait Islander communities has a small impact on estimates, except for the NT, where such persons make up more than 20 per cent of the population.

Data were self-reported for this indicator.

Timeliness

Collection interval/s: Patient Experience data are collected annually.

Data available: The data used for this indicator became available 22 November 2013 for 2012-13, 28 November 2014 for 2013-14 and 13 November 2015 for 2014-15.

Referenced Period: July 2014 to June 2015 (2014-15 data); July 2013 to June 2014 (2013-14 data); July 2012 to June 2013 (2012-13 data).

There are not likely to be revisions to these data after their release.

Accuracy

Method of Collection: Data were collected by computer assisted telephone interview for all iterations of the Patient Experience Survey. Data from an additional sample for the 2013-14 Patient Experience Survey were predominantly collected face-to-face (see below for more information).

Data Adjustments: Data were weighted to represent the total in scope Australian population, and were adjusted to account for confidentiality and non-response.

Sample/Collection size: The sample for the 2014-15 survey was 27 341 fully-responding persons.

Response rate: Response rate for the 2014-15 survey was 73 per cent.

As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95% confidence intervals. Estimates with a relative standard error between 25% and 50% should be used with caution, and estimates with a relative standard error over 50% are considered too unreliable for general use.

This indicator generally has acceptable levels of sampling error and provides reliable data for most breakdowns. However, RSEs for the 'other' remoteness category are high when cross classified by State. Caution should be used when interpreting these data.

The data for this indicator is attitudinal, as it collects whether people felt the health professional in question spent enough time with them, listened carefully and showed them respect.

Data is used from personal interviews only (i.e. excluding proxy interviews).

Explanatory footnotes are provided for each table.

Information specific to the 2013-14 and preceding Patient Experience Surveys:

For the 2013-14 Patient Experience Survey, an additional sample was selected in particular areas using a separate survey called the Health Services Survey (HSS). The HSS collected the same information as the Patient Experience Survey, with

enumeration taking place between September 2013 and December 2013. The additional sample was collected to improve the quality of estimates at the Medicare Local catchment level. Sample from the Patient Experience Survey and HSS were combined to produce output.

The data was predominantly collected by computer assisted telephone interview, although the HSS interviews were predominantly conducted face-to-face. MPHS PEx included one person aged 15 years and over from each household, while the HSS included two persons aged 15 and over from each household.

Analysis was conducted to determine whether there was any difference between the estimates which would have been obtained using the MPHS PEx sample only and estimates obtained using the combined MPHS PEx and HSS sample. This was particularly important given the predominantly different modes used between the two surveys (the majority of MPHS PEx interviews were conducted over the telephone while a larger proportion of HSS interviews were conducted face-to-face and included up to two persons per household). This analysis showed that combining the sample from the two surveys did not produce significantly different estimates. Therefore, estimates can be compared over time with other iterations of the Patient Experience Survey.

Response rate and sample size: The response rate in 2013-14 to the MPHS PEx was 77% (27,327 fully responding persons) while the response rate to HSS was 83% (8,541 fully responding persons) resulting in a total sample size of 35,868 fully responding persons. This included 629 proxy interviews for people aged 15 to 17 where permission was not given by a parent or guardian for a personal interview.

Note this is a substantial increase from the 2012-13 sample size of 30,749. This increase will improve the reliability of the data, particularly at finer levels of disaggregation.

Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Data for MPHS PEx and HSS were weighted separately and then combined to produce output.

Coherence

2009 was the first year data was collected for this indicator. Questions relating to this indicator were also asked in 2010-11, 2011-12, 2012-13 and 2013-14.

Consistency over time: Data are comparable over time.

Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other.

The numerator and denominator are compiled from a single source.

Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete Indigenous communities in the 2011-12 and subsequent surveys, and of very remote communities and discrete Indigenous communities in previous surveys, will affect the NT more than it affects other jurisdictions (people usually resident in such areas/communities account for more than 20 per cent of people in the NT).

Jurisdiction/Australia estimate calculation: All estimates are compiled the same way.

Collections across populations: Data is collected the same way across all jurisdictions.

The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources.

Due to differences in survey scope, collection methodology and question wording, these data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).

Accessibility

Data are publicly available in *Health Services: Patient Experiences in Australia, 2009* (Cat. no. 4839.0.55.001), *Patient Experiences in Australia: Summary of Findings, 2010-11, 2011-12, 2012-13, 2013-14* and 2014-15 (Cat. no. 4839.0).

Data are not available prior to public access.

Supplementary data are available. Additional data from the Patient Experience Survey are available upon request.

Access permission/Restrictions: Customised data requests may incur a charge.

Contact Details: For more information, please call the ABS National Information and Referral Service 1300 135 070.

Interpretability

Context: The data were collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data were collected over a twelve month period which should minimise any seasonality effects in the data.

The 2014-15 ABS Patient Experience data are published in *Patient Experiences in Australia: Summary of Findings, 2014-15* (Cat. no. 4839.0). The publication includes explanatory and technical notes.

Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in the publication.

Data Gaps/Issues Analysis

Key data gaps /issues

- Data from the Patient Experience survey are not comparable with data from the 2012-13 NATSIHS. Disaggregation of this indicator by Indigenous status is a priority.
- The inclusion of very remote areas from the 2011-12 survey improves the comparability of NT data, although the exclusion of discrete Aboriginal and Torres Strait Islander communities will affect the NT more than it affects other jurisdictions.
- The sample size increase from 30 749 in 2012-13 to 35 868 in 2013-14 strengthens reliability of the population level estimates.

Cost to government of general practice per person

Data quality information has been developed for this indicator by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Cost to government of general practice per person

Measure/s (computation)

Government Expenditure on GPs per person

Definition: Cost to government of general practice per person in the population Numerator: Nominal expenditure on services rendered by GPs and OMPs.

Denominator: Estimated Resident Population (ERP).

Computation: Numerator ÷ Denominator, directly age-standardised from 2012-13; crude

rates for previous years.

Data are deflated using the General Government Final Consumption Expenditure (GGFCE) chain price deflator (2014-15 = 100) to provide real expenditure, comparable

over time.

Data source/s

Numerator:

- For MBS data: Department of Human Services (DHS), Medicare data sourced by the Australian Government Department of Health
- For DVA data: Australian Government Department of Veterans' Affairs (DVA) Statistical Services and Nominal Rolls using the Departmental Management Information System (DMIS). These data are known as Treatment Account System (TAS) data.

Denominator: Australian Bureau of Statistics (ABS) Estimated Resident Population (ERP) as at 31 December.

Data Quality Framework Dimensions

Institutional environment

DHS, Medicare processes and collects MBS data for:

- claims made through the MBS under the *Health Insurance Act 1973*. These data are regularly provided to Australian Government Department of Health.
- claims for DVA Treatment Card holders, also made through the MBS, under the Veterans' Entitlements Act 1986; Military Rehabilitation and Compensation Act 2004 and Human Services (Medicare) Act 1973. All claims data are regularly provided to DVA as per the Memorandum of Understanding between DHS, Medicare and DVA.

MBS claims data are an administrative by-product of the DHS, Medicare fee for-service payment systems.

Relevance

The measure relates to:

• services provided by GPs and, for MBS data, OMPs (DVA data include only services provided by specialist GPs) for which DHS, Medicare has processed a claim.

Claims allocated to state/territory based on location at which service rendered.

Data exclude costs for primary healthcare services provided by salaried GPs in community health settings, particularly in rural and remote areas, through emergency departments, and Indigenous-specific primary healthcare services. Consequently, this indicator will understate costs for primary care in jurisdictions with larger proportions of rural and remote populations, where a salaried GP services delivery model is used.

From 2012-13, data exclude expenditure on services provided under the Practice incentive program (PIP), Medicare Locals and the General Practice Immunisation Incentive Scheme (GPII) as these data cannot be subjected to age-standardisation.

Timeliness

Data include all claims processed in the reference period.

Accuracy

From 2012-13, DHS, Medicare data include claimed services by GPs and OMPs as well as by practice nurses or registered Aboriginal health workers for and on behalf of the

GMP/OMP. For previous years, DHS, Medicare data also include services rendered under PIP, DGPP and GPII. DVA data are limited to claims for services provided by specialist GPs.

Data include all claims processed in the reference period.

Coherence

A revised Major Specialty Algorithm is used to identify GPs. Historical data have been revised and so there is coherence over time in the data presented in this Report. However, data are not comparable with data in previous editions of the report for which a different Major Specialty Algorithm methodology was used.

DHS, Medicare and DVA nominal expenditure data are provided separately to and compiled by the Secretariat. Age-standardised rates reported from 2012-13 are not comparable with crude rates reported for 2011-12 and previous years due to the effect of age standardisation and the exclusion of services rendered under PIP, DGPP and GPII from age standardised rates.

Expenditure per person data computed by the Secretariat using the 2011 Census-based ERP as at 31 December for all reference periods.

Accessibility

Information is available for MBS Claims data from http://www.humanservices.gov.au/corporate/statistical-information-and-data/?utm id=9.

DVA data are not publically accessible.

Interpretability

DHS, Medicare claims statistics are available at www.health.gov.au/internet/main/publishing.nsf/Content/Medicare+Statistics-1

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

 Data exclude costs for primary healthcare services provided by salaried GPs in community health settings, particularly in rural and remote areas, through emergency departments, and Indigenous specific primary healthcare services. Consequently, this indicator will understate costs for primary care in jurisdictions with larger proportions of rural and remote populations, where a salaried GP services delivery model is used.

Child immunisation coverage

Data quality information has been developed for this indicator by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element

Outcome

Indicator

Child immunisation coverage.

Measure/s (computation)

Proportion of children who are fully vaccinated at the age of:

- 12 months to less than 15 months
- 24 months to less than 27 months
- 60 months to less than 63 months.

Definition: Proportion of children who are fully vaccinated at the specified ages.

Numerator: children who turned 1, 2 and 5 years of age in the reference year who were recorded as fully vaccinated on the Australian Childhood Immunisation Register (ACIR) in the reference year.

Denominator: number of children who turned 1, 2 and 5 years in the reference year registered on ACIR.

Computation: $100 \times (Numerator \div Denominator)$, presented as a rate per 100 children aged 1, 2 and 5 years.

Data source/s

The Australian Childhood Immunisation Register (ACIR).

Data Quality Framework Dimensions

Institutional environment

The ACIR is administered and operated by Australian Government Department of Human Services (DHS), Medicare. DHS, Medicare provides Australian Government Department of Health with quarterly coverage reports at the national and state level.

Immunisations are notified to DHS, Medicare by a range of immunisation providers including General Practitioners, Councils, Aboriginal Medical Services, State and Territory Health departments.

For information on the institutional environment of the ACIR, including the legislative obligations of the ACIR, financing and governance arrangements, and mechanisms for scrutiny of ACIR operations, please see www.humanservices.gov.au/customer/services/medicare/australian-childhood-immunisation-register.

The tables for this indicator were prepared by DHS, Medicare and quality assessed by Australian Government Department of Health. Australian Government Department of Health drafted the initial data quality statement (including providing input about the methodology used to extract the data and any data anomalies).

Relevance

The ACIR records details of vaccinations given to children under seven years of age who live in Australia.

Children assessed as fully immunised at one year of age are immunised against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, Haemophilus influenzae type b and, from the guarter ending 31 December 2013, pneumococcal.

Children assessed as fully immunised at two years of age are immunised against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, Haemophilus influenzae type b, measles, mumps and rubella and, from the quarter ending 31 December 2014, meningiococcal C and varicella (chickenpox).

A child is assessed as fully immunised at five years of age if they have received immunisations against diphtheria, tetanus, pertussis, polio, measles, mumps and rubella.

There are possible gaps in coverage due to unknown vaccination status of children less than 5 years migrating to Australia. The extent of this is not currently quantifiable.

The analyses by state/territory are based on postcode of residence of the child as recorded on ACIR.

Timeliness

ACIR data are reported quarterly. Data are processed on 30 June in the reference year as a minimum 3-month lag period is allowed for late notification of immunisations to ACIR.

Accuracy

Vaccination coverage rates calculated using ACIR data are believed to underestimate actual vaccination rates because of under-reporting by immunisation providers. However, the extent of any under-reporting has not been estimated.

Provider notification payments and links to family assistance payments for parents have helped minimise under-reporting by providing a financial incentive for parents to vaccinate their children and for providers to notify the ACIR.

The data contains minimal if any duplication of immunisations, as children are identified via their DHS, Medicare number. Approximately 99 per cent of children are registered with DHS, Medicare by 12 months of age.

The ACIR covers virtually all children, particularly because participation in the ACIR is via an 'opt-out' arrangement.

Coherence

The definitions of numerators and denominators have been consistent since the inception of the ACIR in 1996.

Accessibility

Information contained in the indicator for disaggregation by Indigenous status and remoteness are not publicly accessible. Current total percentage and total numbers can be viewed on the DHS. Medicare web site.

DHS, Medicare publishes current immunisation coverage from the ACIR on its website, www.medicareaustralia.gov.au/provider/patients/acir/statistics.jsp.

Authorised immunisation providers can access detailed reports via a secured area of the DHS, Medicare web site.

Immunisation coverage data derived from the ACIR have been reported in Communicable Disease Intelligence since early 1998. Data for 3 key milestone ages (12 months, 24 months and 5 years [6 years prior to 2008]), nationally and by jurisdiction are published quarterly.

Interpretability

Further information on the ACIR can be found at www.humanservices.gov.au/customer/services/medicare/australian-childhood-immunisation-register. Information on the National Immunisation Program and vaccinations can be found at www.immunise.health.gov.au.

Data Gaps/Issues Analysis

Key data gaps /issues

- The data used to calculate this indicator are from an administrative data collection—
 the Australian Childhood Immunisation Register (ACIR) for which there is an
 incentive payment for notification, and there are further incentives for parents to
 have their child's vaccination status up to date. The Register is linked to the DHS,
 Medicare enrolment register, and approximately 99 per cent of children are
 registered with DHS, Medicare by 12 months of age.
- Data have been reported using the program definition of fully immunised for children aged 12 to 15 months; that is, children who have received vaccinations against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, Haemophilus influenzae type b and, from the quarter ending 31 December 2013, pneumococcal.
- Data have been reported using the program definition of fully immunised for children aged 24 to 27 months; that is, children who have received vaccinations against diphtheria, tetanus, pertussis (whooping cough), polio, hepatitis B, Haemophilus influenzae type b, measles, mumps, and rubella and, from the quarter ending 31 December 2014, meningiococcal C and varicella (chickenpox).
- Data have been reported using the program definition of fully immunised for children aged 60 to 63 months; that is, children who have received vaccinations against diphtheria, tetanus, pertussis, polio, measles, mumps and rubella.
- From 31 December 2017, reporting of vaccination coverage will be amended to remove the assessment of MMR in the 60 to < 63 month cohort.
- Given these changes, trends in vaccination coverage rates over time need to be interpreted carefully.

Notifications of selected childhood diseases

Data quality information has been developed for this indicator by the Health Working Group with additional Steering Committee comments.

Indicator definition and description

Element

Outcome

Indicator

Notifications of selected childhood diseases.

Measure/s (computation)

Measures:

- Notifications of measles for children aged 0–14 years
- Notifications of whooping cough (pertussis) for children aged 0-14 years
- Notifications of invasive Haemophilus influenzae type b (Hib) for children aged 0–14 years

Definition: Number of notifications reported to the National Notifiable Diseases Surveillance System (NNDSS) by State and Territory health authorities for children aged 0–14 years by date of diagnosis, per 100 000 children aged 0–14 years for:

- measles
- whooping cough (pertussis)
- invasive Haemophilus influenzae type b (Hib).

Numerator: number of notifications reported to the NNDSS for children aged 0–14 years in the reference year.

Denominator: estimated resident population of children aged 0–14 years at 31 December in the reference year.

Computation: 100 × (Numerator ÷ Denominator), presented as a rate per 100 000 children aged 0–14 years.

Data source/s

Numerator: The National Notifiable Diseases Surveillance System (NNDSS)

Denominator: Australian Bureau of Statistics (ABS) Estimated Resident Population (ERP) at 31 December in the reference period (ABS Australian Demographic Statistics (various years), Cat. no. 3101.0).

Data Quality Framework Dimensions

Institutional environment

The NNDSS is administered and operated by the Department of Health.

Notifiable diseases are notified to the relevant State/Territory government health departments by clinicians and laboratories under jurisdictional public health legislation. The Department of Health receives data for these notifiable diseases under the *National Health Security Act 2007*.

For information on the institutional environment of the NNDSS, including the legislative obligations of the NNDSS, financing and governance arrangements, and mechanisms for scrutiny of NNDSS operations, please see www.health.gov.au/internet/main/publishing.nsf/Content/cda-cdi2903q.htm.

Relevance

Nationally notifiable diseases require notification of the relevant State/Territory health authority upon diagnosis. Cases are defined on the basis of the Communicable Diseases Network Australia (CDNA) NNDSS case definitions. State/Territory health authorities notify the NNDSS of notified cases.

Allocation to State/Territory is by postcode of residence of the case as provided by the notifying doctor or laboratory.

Timeliness

State/Territory health authorities notify data to the NNDSS on a daily basis. Data include all notifications for the selected diseases for each reference period (financial year).

Accuracy

Measles and invasive Hib

The 'notified fraction' represents the proportion of total cases for which notification is made. This is expected to be high for measles and invasive Hib as it is uncommon for either disease to go undiagnosed, due to the often severe presentations of the disease.

Comprehensive follow up of the contacts of all cases also enables identification of cases.

Pertussis (whooping cough)

The notified fraction for whooping cough is likely to be only a proportion of the total number of cases that occur, as identification of pertussis is limited by patient and physician awareness, testing practices and in some cases, the united sensitivity of diagnostics tests. Pertussis is generally believed to be significantly under-diagnosed.

ERPs to 31 December 2010 are the ABS' final 2011 Census rebased ERPs. ERPs from 31 December 2011 are ABS first preliminary estimates based on the 2011 Census.

Data for the number of notifications are suppressed for confidentiality reasons where the number of notifications was less than 3.

Data for notification rates are suppressed where there were less than 5 notifications.

Coherence

Data are reported for 2006-07 to 2014-15. Reference periods comprise the complete financial year. Data may differ from other reports that use a different reference period.

Changes in surveillance and testing methods over time and by jurisdiction may make comparisons both over time and across jurisdictions difficult. Changes in the national case definition criteria for establishing a case may affect the coherence of the data over time. The current NNDSS case definition, including historical edits, can be found at www.health.gov.au/casedefintions.

Pertussis

Epidemics of pertussis in Australia historically occur at regular intervals of approximately 4 years on a background of endemic circulation, resulting in large fluctuations in notification numbers over time. The large variations in pertussis notifications in states and territories during this reporting period are mainly due to a nationwide epidemic that commenced in 2008 and peaked in 2011. The timing of each jurisdiction's peak whooping cough activity varied during this time. NSW and Victoria are currently experiencing increased levels of pertussis activity which began during 2014.

Accessibility

The Department of Health publishes aggregated levels of data from the NNDSS on its website www9.health.gov.au/cda/source/cda-index.cfm. Data are updated on a daily basis.

Interpretability

The current NNDSS case definitions, including edits, can be found at www.health.gov.au/internet/main/publishing.nsf/Content/cdna-casedefinitions.htm.

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

Whooping cough notifications may undercount the actual number of cases that occur
as diagnosis cannot always be confirmed using currently available diagnostic tools.

Participation rates for women in cervical screening

Data quality information for this indicator has been drafted by the AIHW, with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Participation rates for women in cervical screening.

Measure/s (computation)

Definition:

This indicator presents the number of women within the national target age group (20–69 years) screened in a 2 year period as a proportion of the eligible female population and age standardised to the Australian standard population at 30 June 2001.

The eligible female population is the average of the Australian Bureau of Statistics (ABS) estimated resident female population for the 2 year reporting period. This population is adjusted for the estimated proportion of women who have had a hysterectomy using national hysterectomy fractions derived from the AIHW National Hospitals Morbidity Database.

Numerator: Total number of women aged 20–69 years who were screened in the 2 year period.

Denominator: Average number of women aged 20–69 years in the same 2 year period, adjusted using national hysterectomy fractions to exclude the estimated number of women who have had a hysterectomy.

Computation/s: 100 \times (Numerator \div Denominator) and age-standardised to the Australian population at 30 June 2001.

Data source/s

Numerator: State and territory cervical cytology registers.

Denominator: ABS estimated resident population 2011 Census based (ERP) for females aged 20–69 years adjusted using national hysterectomy fractions derived from the AIHW National Hospitals Morbidity Database.

Data Quality Framework Dimensions

Institutional environment

The National Cervical Screening Program (NCSP) is a joint program of the Australian Government and State and Territory governments. The target age group is women aged 20–69 years.

Cervical cytology registries in each state and territory are maintained by jurisdictional Program managers. Data are supplied to the registries from pathology laboratories. Data from cervical cytology registers are provided to the Australian Institute of Health and Welfare (AIHW) annually in an aggregated format.

The NCSP is monitored annually. Results are compiled and reported at the national level by the AIHW in an annual Cervical screening in Australia report.

The Institute is an independent statutory authority within the Health and Ageing portfolio. It is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website (www.aihw.gov.au).

Relevance

The data used to calculate this indicator are accurate and of high quality. The cervical cytology registers collect information on all Pap tests undertaken in Australia except where women advise the clinician they do not wish to have their data collected. The use of ERP based on Census data for denominators provide the most comprehensive data coverage possible. The data are entirely appropriate for this indicator.

For participation by state and territory, the numerator is the number of women aged 20–69 years screened in each state and territory in the reference period, except for Victoria and the ACT where data are for residents (and some immediate border residents) of the jurisdiction only. Data are supplied as aggregated data by each state and territory. The denominator is the average of the ABS ERP for women aged 20–69 years in each State

and Territory, adjusted to exclude the estimated number of women who have had a hysterectomy, using national hysterectomy fractions.

Caution is required when examining differences across states and territories of Australia due to the substantial differences in population, area, geographic structure, policies and other factors.

Timeliness

The most recent data available for the 2015 RoGS report are based on the two-year calendar period 1 January 2012 to 31 December 2013. Data are presented as a rate for the two-year period to reflect the recommended screening interval.

Accuracy

This indicator is calculated on data that have been supplied to the AIHW by individual state and territory registers. Prior to publication, the results of analyses are referred back to states and territories for checking and clearance. Any errors found by states and territories are corrected once confirmed. Thus participation by state and territory, based on the state or territory in which the woman was screened, is both robust and readily verified.

Women who opt off the cervical cytology register are not included in the participation data, but this is thought to only exclude around 1 per cent of all women screened.

Coherence

Some of these data are published annually in Program monitoring reports prepared by the AIHW and are consistent across reports published at similar times.

Rates may differ from those presented in reports published in 2011 or previous years which are derived from ABS 2006 Census based ERPs.

Accessibility

The NCSP annual reports are available via the AIHW website where they can be downloaded free of charge.

Interpretability

While numbers of women screened are easy to interpret, calculation of age standardised rates with allowance for the proportion of the population who have had a hysterectomy is more complex and the concept may be confusing to some users. Information on how and why age-standardised rates have been calculated and how to interpret them as well as the hysterectomy fraction is available in all AIHW NCSP monitoring reports, example, Cervical screening in Australia 2011–2012.

Data Gaps/Issues Analysis

Key data gaps /issues

- Hysterectomy fractions are derived from the AIHW National Hospitals Morbidity Database.
- Indigenous status is not collected by cervical cytology registers.

Selected potentially preventable hospitalisations

Measure 1: Selected potentially preventable hospitalisations for vaccine preventable, acute and chronic conditions

Data quality information for this measure has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Outcome — Australians receive appropriate high quality and affordable hospital and

hospital related care.

Indicator Selected potentially preventable hospitalisations — Admissions to hospital that could

have potentially been prevented through the provision of appropriate non-hospital

services.

Measure/s (computation)

Selected potentially preventable hospitalisations for vaccine-preventable, acute and chronic conditions.

The numerator is the number of separations for selected potentially preventable hospitalisations, for each of the following three groups and their sub-categories:

- · Vaccine-preventable conditions
 - Pneumonia and influenza (vaccine-preventable)
 - Other vaccine preventable conditions (for example, tetanus, measles, mumps, rubella)
 - Total.
- Acute conditions
 - Cellulitis
 - Convulsions and epilepsy
 - Dental conditions
 - Ear, nose and throat infections
 - Eclampsia
 - Gangrene
 - Pelvic inflammatory disease
 - Perforated/bleeding ulcer
 - Pneumonia (not vaccine-preventable)
 - Urinary tract infections, including pyelonephritis
 - Total acute conditions
- · Chronic conditions
 - Angina
 - Asthma
 - Bronchiectasis
 - Chronic obstructive pulmonary disease
 - Congestive heart failure
 - Diabetes complications (principal diagnosis only)
 - Hypertension
 - Iron deficiency anaemia
 - Nutritional deficiencies
 - Rheumatic heart disease
 - Total
- Total selected potentially preventable hospitalisations.

The denominator is the Estimated Resident Population (ERP).

A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay

beginning or ending in a change of type of care (for example, from acute care to rehabilitation).

Potentially preventable hospitalisations are defined by International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM) diagnosis codes and/or Australian Classification of Health Interventions (ACHI) procedure codes in scope for each category of potentially preventable hospitalisations (see METeOR id 559032).

Calculation is 1000 × (Numerator ÷ Denominator), presented as a number per 1000 and age standardised to the Australian population as at 30 June 2001 using 5-year age groups to 84 years, with ages over 84 combined. Indigenous population data are not available for all states and territories for 5-year age groups beyond 64 years, so the Indigenous disaggregation was standardised to 64 years, with ages over 64 combined.

Data source/s

Numerator: This indicator is calculated using data from the NHMD, based on the NMDS for Admitted Patient Care.

Denominators:

- For total population: ABS Estimated Resident Population (ERP) as at 30 June 2013.
- For data by Indigenous status: ABS Aboriginal and Torres Strait Islander Experimental Estimates and Projections (Indigenous Population) Series B as at 30 June 2013.
- For data by remoteness: ABS ERP as at 30 June 2013, by remoteness areas, as specified in the Australian Statistical Geography Standard 2011 (ASGS).
- For data by socioeconomic status: calculated by AIHW using the ABS Socio-Economic Indexes For Areas (SEIFA) Index of Relative Socio-economic Disadvantage (IRSD) 2011 and ERP by Statistical Area 2 (SA2) as at 30 June 2013. Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

Computation: 1000 × (Numerator ÷ Denominator), presented as a rate.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator.

The AIHW is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NHMD were supplied to the AIHW by state and territory health authorities

under the terms of the National Health Information Agreement (see the following links):

- http://www.aihw.gov.au/nhissc/
- http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

The analyses by state and territory, remoteness and socioeconomic status are based on the Statistical Area 2 (SA2) of usual residence of the patient, not the location of the hospital. Hence rates represent the number separations for patients living in each state/territory, remoteness area or Socio-Economic Indexes for Areas (SEIFA) population group (regardless of the jurisdiction of the hospital they were admitted to) divided by the total number of people living in that remoteness area or SEIFA group in the state/territory.

The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness

The reference period for this data set is 2013-14.

Accuracy

For 2013-14, almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the ACT.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

The AIHW report *Indigenous identification in hospital separations data: quality report* (AIHW 2013) found that nationally, about 88 per cent of Indigenous Australians were identified correctly in hospital admissions data in the 2011-12 study period, and the 'true' number of separations for Indigenous Australians was about 9 per cent higher than reported. The report recommended that the data for all jurisdictions are used in analysis of Indigenous hospitalisation rates, for hospitalisations in total in national analyses of Indigenous admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status data.

Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for

example where the denominator is very small. The following rule was applied:

Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 1000.

Coherence

The specification for this performance indicator was revised for the 2015 Report. The AIHW recalculated this indicator for the period 2007-08 to 2012-13 using the new specification. Therefore, the data are not comparable to data published in previous editions of the Report.

For ICM-10-AM coding details, please refer to the specification for National Healthcare Agreement Performance Indicator 18 - Selected potentially preventable hospitalisations, 2015 (http://meteor.aihw.gov.au/content/index.phtml/itemId/559032)

The information presented for this indicator is calculated using the same methodology as data published in the *National healthcare agreement: performance report 2012–13*.

However, caution should be used when comparing data across reporting periods as changes between the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM) 5th edition (used in 2007-08), ICD-10-AM 6th edition (used in 2008-09 and 2009-10), ICD-10-AM 7th edition (used in 2010-11, 2011-12 and 2012-13) and ICD-10-AM 8th edition (used in 2013—14) and the associated Australian Coding Standards that resulted in fluctuations in the reporting of diagnoses for diabetes. In addition, changes to the Australian Coding Standard for Viral hepatitis (ACS 0104), implemented in the 8th edition of ICD-10-AM will affect the comparability over time in the reporting of the vaccine-preventable category of potentially preventable hospitalisations, which includes counts for additional diagnoses of Hepatitis B.

In addition, Tasmanian data are not comparable over time as 2008-09 data for Tasmania does not include two private hospitals that were included in 2007-08 and 2009-10 data reported in the National Healthcare Agreement performance reports.

Interpretation of the related performance benchmark over time is also problematic because the benchmark is specified as a proportion of separations rather than a population rate, and admission practices vary across jurisdictions and over time. Changes in a jurisdiction's denominator (separations) can artificially increase or decrease the results of the benchmark. Therefore the data provided in 2013-14 (and interim years) may not be directly comparable to the baseline data from which the target is based.

Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

National level data disaggregated by Indigenous status for 2007-08 to 2009-10 include data from NSW, Vic, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2010-11 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007-08, 2008-09 and 2009-10 are not comparable to data for 2010-11 and subsequent years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006.

In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. Data for 2012-13 are reported using SEIFA 2011 at the SA2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data

for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012-13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables.
- Interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: www.aihw.gov.au/hospitals/.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Indigenous data, and variation in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at www.aihw.gov.au/ publication-detail/?id=10737422826

The Data Quality Statement for the NHMD can be accessed on the AIHW website at http://meteor.aihw.gov.au/content/index.phtml/itemId/568730.

Data Gaps/Issues Analysis

Key data gaps /issues

- The National Hospital Morbidity Database (NHMD) is a comprehensive data set that has records for all separations of admitted patients from essentially all public and private hospitals in Australia
- The specification for this performance indicator was revised for the 2015 Report. The AIHW recalculated this indicator for the period 2007-08 to 2012-13 using the new specification. Therefore, the data are not comparable to data published in previous editions of the Report.
- Caution should be used in comparing data across reporting periods as changes between the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM) 5th edition (used in 2007-08), ICD-10-AM 6th edition (used in 2008-09 and 2009-10), ICD-10-AM 7th edition (used in 2010-11, 2011-12 and 2012-13) and ICD-10-AM 8th edition (used in 2013-14) and the associated Australian Coding Standards resulted in fluctuations in the reporting of diagnoses for diabetes (chronic category affected). These changes should also be taken into consideration in interpretation of these data against the National Healthcare Agreement performance benchmark for potentially preventable hospitalisations. In addition, changes to the Australian Coding Standard for Viral hepatitis (ACS 0104), implemented in the 8th edition of ICD-10-AM will affect the comparability over time in the reporting of the vaccine-preventable category of potentially preventable hospitalisations, which includes counts for additional diagnoses of Hepatitis B.
- In addition, interpretation of the related performance benchmark over time is problematic because the benchmark is specified as a proportion of separations rather than a population rate, and admission practices vary across jurisdictions and
- The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.
- · Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.
- Remoteness data for 2011-12 and previous years are not directly comparable to remoteness data for 2012-13 and subsequent years.
- SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Measure 2: Selected potentially preventable hospitalisations for diabetes

Data quality information for this measure has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Selected potentially preventable hospitalisations.

Measure/s (computation)

Selected potentially preventable hospitalisations for diabetes.

The numerator is the number of hospitalisations for type 2 diabetes mellitus (as principal or additional diagnosis), divided into seven groups:

- Circulatory complications (E11.5x)
- Renal complications (E11.2x)
- Ophthalmic complications (E11.3x)
- Other specified complications (E11.0x, E11.1x, E11.4x, E11.6x)
- Multiple complications (E11.7x)
- No complications (E11.9x)
- Total.

The denominator is the Estimated Resident Population.

A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation).

Potentially preventable hospitalisations for diabetes are defined by ICD-10-AM diagnosis codes.

Calculation is 100 000 × (Numerator ÷ Denominator), presented as a number per 100 000 and age-standardised to the Australian population as at 30 June 2001 using 5-year age groups to 84 years, with ages over 84 years combined.

Data source/s

Numerator: This indicator is calculated using data from the NHMD, based on the National Minimum Data Set for Admitted Patient Care.

Denominator: For total population: ABS Estimated Resident Population (ERP) as at 30 June 2011.

Computation: 1000 × (Numerator ÷ Denominator), presented as a rate.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator.

The Institute is an independent statutory authority within the Health and Ageing portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the Institute by state and territory health authorities. The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the terms of the National Health Information Agreement, available online at: www.aihw.gov.au/WorkArea/DownloadAsset.aspx?id=6442472807&libID=6442472788

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the

Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness

The reference period for this data set is 2013-14.

Accuracy

Reporting of diabetes increased by on average 29.6 per cent for diabetes as a principal diagnosis and 247 per cent for diabetes as an additional diagnosis, between 2011-12 and 2012-13 — in large part due to changes in Australian Coding Standards. Accordingly, data for 2012-13 are not comparable with data for previous years.

For 2013-14 almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the ACT.

States and territories are primarily responsible for the quality of the data they provide. However, the Institute undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked with data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions. Variations in both admission and administration practices and policies mean that dialysis treatments may be counted as separations with diabetes complications by some hospitals and not others, reducing the comparability of the data at state and territory level. This is particularly significant for Indigenous people because of the high prevalence of diabetes in that population.

Cells have been suppressed to protect confidentiality (where the presentation could identify a patient or a single service provider) or where rates are likely to be highly volatile (for example, the denominator is very small).

Coherence

The information presented for this indicator is calculated using the same methodology as other potentially preventable hospitalisations data published in Australian hospital statistics 2013-14.

Reporting of diabetes increased by on average 29.6 per cent for diabetes as a principal diagnosis and 247 per cent for diabetes as an additional diagnosis, between 2011-12 and 2012-13 — in large part due to changes in Australian Coding Standards. Accordingly, data for 2012-13 are not comparable with data for previous years.

Changes between the ICD-10-AM 5th edition (used in 2007-08), ICD 10-AM 6th edition (used in 2008-09 and 2009-10) and ICD-10-AM 7th edition (used in 2010-11 and 2011-12) and the associated Australian Coding Standards apparently resulted in decreased reporting of additional diagnoses for diabetes.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables.
- Interactive data cube for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

Some data are also included on the MyHospitals website.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Indigenous data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Admitted patient care are published in the AIHW's online metadata repository — METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps

The Steering Committee notes the following issues:

/issues

- Further work is required to improve the comparability of data due to changes across editions of the ICD-10-AM.
- The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.
- Changes to Australian Coding Standards mean that data for 2012-13 are not comparable to data for previous years.

Measure 3: Potentially preventable hospitalisations of older people for falls

Data quality information for this measure has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Selected potentially preventable hospitalisations.

Measure/s (computation)

Potentially preventable hospitalisations of older people for falls.

The number of hospitalisations for people aged 65 years or over with a reported external cause of falls, per 1000 people.

The numerator is the number of hospitalisations for people aged 65 years or over with a reported external cause of falls.

The denominator is the Estimated Resident Population.

A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation).

Potentially preventable hospitalisations for falls are defined by ICD-10-AM external cause codes (W00–W19).

Calculation is 1000 × (Numerator ÷ Denominator), presented as a number per 1000 and age standardised to the Australian population as at 30 June 2001 using 5-year age groups to 84 years, with ages over 84 combined.

Data source/s

Numerator: This indicator is calculated using data from the NHMD, based on the National Minimum Data Set for Admitted Patient Care.

Denominator: ABS Estimated Resident Population (ERP) as at 30 June in the year preceding the reference period.

Computation: 1000 × (Numerator ÷ Denominator), presented as a rate.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator.

The Institute is an independent statutory authority within the Health and Ageing portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the Institute by state and territory health authorities. The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the terms of the National Health Information Agreement, available online at:www.aihw.gov.au/WorkArea/DownloadAsset.aspx?id=6442472807&libID=6442472788

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness

The reference periods for this data set are 2005-06, 2006-07, 2007-08, 2008-09, 2009-10, 2010-11, 2011-12, 2012-13, 2013-14.

Accuracy

For 2006-07 almost all public hospitals provided data for the NHMD, with the exception of a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private day hospital facilities in the ACT, the single private free standing day hospital facility in the NT, and a small private hospital in Victoria

For 2007-08 almost all public hospitals provided data for the NHMD, with the exception of a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private day hospital facilities in the ACT, the single private free-standing day hospital facility in the NT, and a small private hospital in Victoria

For 2008-09, almost all public hospitals provided data for the NHMD, with the exception of a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private day hospital facilities in the ACT, the single private free-standing day hospital facility in the NT, and two private hospitals in Tasmania

For 2009-10 almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT and about 2400 separations for one public hospital in Western Australia. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the Australian Capital Territory and the Northern Territory. In addition, Western Australia was not able to provide about 10 600 separations for one private hospital.

For 2010-11 and 2011-12, almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the Australian Capital Territory and the Northern Territory. However, 2010-11 data were not available for the NT.

For 2012-13, almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the ACT.

For 2013-14, almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT. The majority of private hospitals provided data, with the exception of the private day hospital facilities in the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the Institute undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked with data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

The AIHW report *Indigenous identification in hospital separations data: quality report* (AIHW 2013) found that nationally, about 88 per cent of Indigenous Australians were identified correctly in hospital admissions data in the 2011 12 study period, and the 'true' number of separations for Indigenous Australians was about 9% higher than reported. The report recommended that data for all jurisdictions are used in analysis of Indigenous hospitalisation rates, for hospitalisations in total in national analyses of Indigenous admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status data.

Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Cells have been suppressed to protect confidentiality (where the presentation could identify a patient or a single service provider) or where rates are likely to be highly volatile (for example, the denominator is very small). Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 1000.

Coherence

NT data are not available for 2010-11, and are excluded from the Australian total for that year. With this exception, data for this indicator are comparable over time.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products

available on the AIHW website are:

- Australian hospital statistics with associated Excel tables.
- Interactive data cube for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

Some data are also included on the MyHospitals website.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Indigenous data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Admitted patient care are published in the AIHW's online metadata repository — METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps /issues

The Steering Committee notes the following issues:

- NT data were not available for 2010-11.
- The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

11 Public hospitals

Attachment tables

Attachment tables are identified in references throughout this chapter by a '11A' prefix (for example, table 11A.1). A full list of attachment tables is provided at the end of this chapter, and the attachment tables are available from the Review website at www.pc.gov.au/rogs/2016.

Public hospitals are important providers of government funded health services in Australia. This chapter reports on the performance of State and Territory public hospitals, focusing on acute care services. It also reports separately on a significant component of the services provided by public hospitals — maternity services.

Improvements to the reporting of public hospitals in this edition include:

- a new measure 'Emergency department waiting time to commencement of clinical care' is reported under the 'Emergency department waiting times' indicator
- a new measure 'Length of stay of emergency department presentations ending in admission' is reported under the 'Waiting times for admitted patient services' indicator

All abbreviations used in this Report are available in a complete list in volume A: Approach to performance reporting.

11.1 Profile of public hospitals

A key objective of Australian governments is to provide public hospital services to ensure the population has access to cost-effective health services, based on clinical need and within clinically appropriate times, irrespective of geographic location. Public hospitals provide a range of services, including:

- acute care services to admitted patients
- subacute and non-acute services to admitted patients (for example, rehabilitation, palliative care and long stay maintenance care)
- emergency, outpatient and other services to non-admitted patients
- mental health services, including services provided to admitted patients by designated psychiatric/psychogeriatric units
- public health services
- teaching and research activities.

This chapter focuses on services provided to admitted patients and emergency services provided to non-admitted patients in public hospitals. These services comprise the bulk of public hospital activity and, in the case of services to admitted patients, have the most reliable data relative to other hospitals data. Data in the chapter include subacute and non-acute care services.

In some instances, data for stand-alone psychiatric hospitals are included in this chapter. However, under the National Mental Health Strategy, the provision of psychiatric treatment is shifting away from specialised psychiatric hospitals to mainstream public hospitals and the community sector. The performance of psychiatric hospitals and psychiatric units of public hospitals is examined more closely in the 'Mental health management' chapter of this Report (chapter 12).

Funding

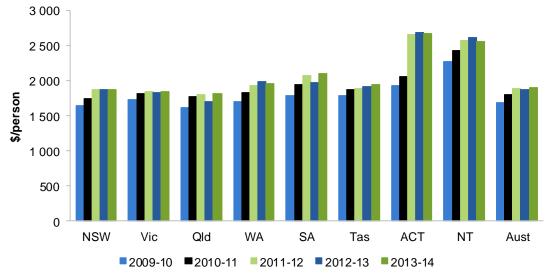

Total recurrent expenditure on public hospitals (excluding depreciation) was \$44.4 billion in 2013-14 (table 11A.1). Funding for public hospitals comes from a number of sources. The Australian, State and Territory governments contributed 91.0 per cent of funding for public hospital services in 2013-14, with non-government sources contributing 9.0 per cent (including depreciation) (table 11A.2). Non-government expenditure comprised revenue from health insurance funds, individuals, workers' compensation and compulsory third-party motor vehicle insurers, and other sources.

Expenditure data in this profile section are sourced from unpublished data from the AIHW Health Expenditure Australia database, and are not directly comparable with other expenditure data used in this chapter, which are drawn from *Hospital resources 2013–14: Australian hospital statistics* (AIHW 2015d). The AIHW publication *Health Expenditure Australia 2013-14* provides information about the differences in the expenditure data between the two sources (AIHW 2015b).

In 2013-14, government real recurrent expenditure on public hospitals was \$1905 per person nationally, up from \$1692 in 2009-10 (figure 11.1). It is difficult to make comparisons across jurisdictions based on these recurrent expenditure data, due to differences in the data coverage. The main differences are:

- the inclusion, by some jurisdictions, of expenditure on community health services as well as public hospital services
- the exclusion, by some jurisdictions, of expenditure on privately owned or privately operated hospitals that have been contracted to provide public hospital services.

Figure 11.1 Real recurrent expenditure per person, public hospitals (including psychiatric) (2013-14 dollars)^a

a See table 11A.3 for detailed footnotes and caveats.

Source: AIHW (various years), Australian hospital statistics, Health Services Series, Cat. nos HSE 107, 117, 134 and 145; AIHW (2015), Hospital resources 2013-14: Australian hospital statistics. Health services series no. 63. Cat. no. HSE 160; AIHW (2015), Health expenditure Australia 2013-14, Health and Welfare Expenditure Series No. 54, Cat. no. HWE 63; table 11A.3.

Size and scope of sector

There are several ways to measure the size and scope of Australia's public hospital sector. This profile section reports on: the number and size of hospitals; the number and location of public hospital beds; the number and type of public hospital separations; the number of separations and incidence of treatment, by the Indigenous status of the patient; the number of hospital staff; and types of public hospital activity.

Hospitals

In 2013-14, Australia had 747 public hospitals (table 11A.4). Although 72 per cent of hospitals had 50 or fewer beds (figure 11.2), these smaller hospitals represented only 15 per cent of total available beds (table 11A.4).

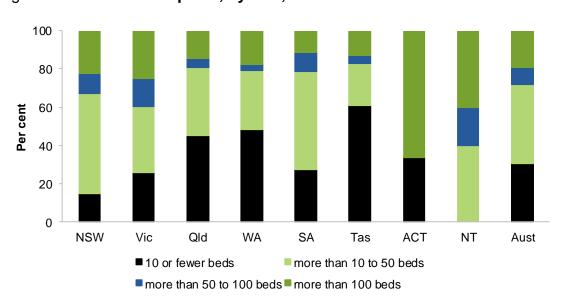

Figure 11.2 Public hospitals, by size, 2013-14a, b

Source: AIHW (2015), Hospital resources 2013-14: Australian hospital statistics. Health services series no. 63. Cat. no. HSE 160; table 11A.4.

Hospital beds

There were 58 567 available beds for admitted patients in public hospitals in 2013-14, equivalent to 2.5 beds per 1000 people (figure 11.3 and table 11A.4). The concept of an available bed is becoming less important in the overall context of hospital activity, particularly given the increasing significance of same day hospitalisations and hospital-in-the-home care (AIHW 2011).

a See table 11A.4 for detailed footnotes and caveats. b The ACT did not have hospitals with more than 10 to 50 beds or more than 50 to 100 beds. The NT did not have hospitals with 10 or fewer beds.

Nationally, more beds were available per 1000 people in remote areas (table 11A.5). The patterns of bed availability can reflect a number of factors, including patterns of availability of other healthcare services, patterns of disease and injury and the relatively poor health of Aboriginal and Torres Strait Islander Australians, who have higher population concentrations in remote areas. These data also need to be viewed in the context of the age and sex structure (chapter 2) and the morbidity and mortality (reported in the 'Health sector overview') of the population in each State and Territory.

The comparability of bed numbers can be affected by the casemix of hospitals, including the extent to which hospitals provide same day admitted services and other specialised services. There are also differences in admission practices and how available beds are counted, both across jurisdictions and over time.

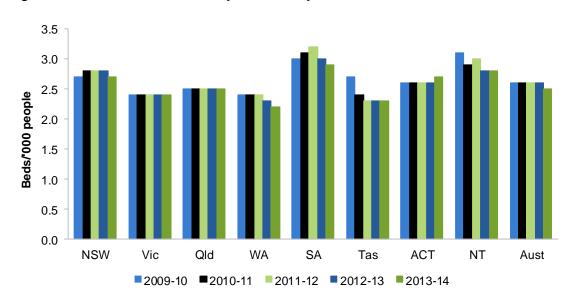

Figure 11.3 Available beds, public hospitals^a

Source: AIHW (various years), Australian hospital statistics, Health Services Series, Cat. nos HSE 107, 117, 134 and 145; AIHW (2015), Hospital resources 2013-14: Australian hospital statistics. Health services series no. 63. Cat. no. HSE 160; table 11A.5.

Admitted patient care

There were approximately 5.7 million separations from public (non-psychiatric) hospitals in 2013-14 (table 11A.6). Nationally, this translates into 234.0 separations per 1000 people (figure 11.4). Acute separations accounted for 95.3 per cent of separations from public hospitals, newborns who required acute care accounted for 1.3 per cent and rehabilitation care accounted for 1.7 per cent. Palliative care, geriatric evaluation and management, and maintenance care constitute the remainder (table 11A.12). Of the total number of separations in public (non-psychiatric) hospitals, 51.4 per cent were for same day patients.

^a See table 11A.5 for detailed footnotes and caveats.

Public psychiatric hospitals accounted for around 0.2 per cent of total separations in public hospitals in 2013-14 (table 11A.6).

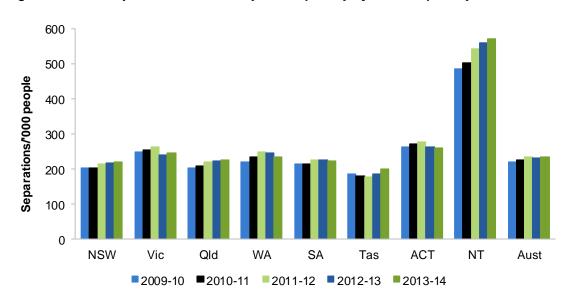

Figure 11.4 Separation rates in public (non-psychiatric) hospitals^a

Source: AIHW (various years), Australian Hospital Statistics, Health Services Series, Cat. nos HSE 107, 117, 134 and 145; AIHW (2015), Admitted patient care 2013-14: Australian hospital statistics. Health services series no. 60. Cat. no. HSE 156; table 11A.7.

Differences across jurisdictions in separation rates reflect variations in the health profiles of the people living in each State and Territory, the decisions made by medical staff about the type of care required and people's access to health services other than public hospitals.

Variations in admission rates can reflect different practices in classifying patients as either admitted same day patients or outpatients. For example, in SA, chemotherapy and scope procedures are treated as outpatient rather than same day services. The extent of differences in classification practices can be inferred from the variation in the proportion of same day separations across jurisdictions for certain conditions or treatments. This is particularly true of medical separations. Significant variation across jurisdictions in the proportion of same day medical separations was evident in 2013-14 (table 11A.8).

Admitted patient care for Aboriginal and Torres Strait Islander Australians

In 2013-14, on an age standardised basis, 800.5 public hospital separations (including same day separations) for Aboriginal and Torres Strait Islander Australians were reported per 1000 Aboriginal and Torres Strait Islander Australians. This rate was markedly higher than the corresponding rate of 234.4 per 1000 for all Australians (figure 11.5).

^a See table 11A.7 for detailed footnotes and caveats.

In 2013-14, separations for Aboriginal and Torres Strait Islander Australians accounted for around 4.2 per cent of total separations and 6.5 per cent of separations in public hospitals (table 11A.9). Aboriginal and Torres Strait Islander Australians made up only around 3 per cent of the population nationally, although this rate varied significantly from 0.9 per cent in Victoria to 29.5 per cent in the NT (tables 2A.1 and 2A.14). Most separations involving Aboriginal and Torres Strait Islander Australians (91.0 per cent) in these jurisdictions occurred in public hospitals (table 11A.9).

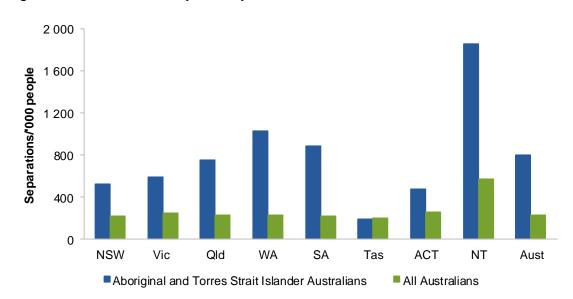

Figure 11.5 Public hospital separations, 2013-14a

Non-admitted patient services

A total of 46.5 million individual occasions of service were provided to non-admitted patients in public acute hospitals in 2013-14, not including Victoria which did not provide occasions of service information (table 11.1). In addition, public hospitals delivered 832 576 group sessions during this time (a group session is defined as a service provided to two or more patients, excluding services provided to two or more family members) (AIHW2015c).

There is considerable variation among states and territories and across reporting years in collection of non-admitted patient occasions of service. Differing admission practices across states and territories also lead to variation among jurisdictions in the services reported (AIHW 2015c).

^a See table 11A.10 for detailed footnotes and caveats.

Source: AIHW (2015), Non-admitted patient care 2013-14: Australian hospital statistics. Health services series no. 62. Cat. no. HSE 159; table 11A.13.

Staff

In 2013-14, nurses comprised the single largest group of full time equivalent (FTE) staff employed in public hospitals (5.6 per 1000 people) (figure 11.6). Comparing data on FTE staff across jurisdictions should be undertaken with care, because these data are affected by differences across jurisdictions in the recording and classification of staff. The outsourcing of services with a large labour related component (for example, food services and domestic services) can have a large impact on hospital staffing figures and can explain some of the differences in FTE staff in some staffing categories across jurisdictions (AIHW 2011).

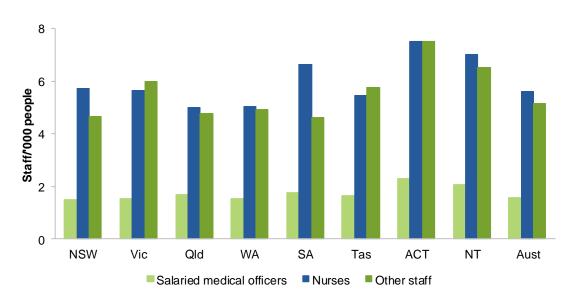

Figure 11.6 Average FTE staff per 1000 people, public hospitals, 2013-14^a

Source: AIHW (2015), Hospital resources 2013-14: Australian hospital statistics. Health services series no. 63. Cat. no. HSE 160; ABS (unpublished), Australian Demographic Statistics, December Quarter 2013, Cat. no. 3101.0; tables 11A.11 and 2A.2.

11.2 Framework of performance indicators for public hospitals

Performance is reported against objectives that are common to public hospitals in all jurisdictions (box 11.1). The Health sector overview explains the performance indicator framework for health services as a whole, including the subdimensions of quality and sustainability that have been added to the standard Review framework.

Box 11.1 **Objectives for public hospitals**

The common government objectives for public hospitals are to provide acute and specialist services that are:

- safe and of high quality
- · appropriate and responsive to individual needs
- · affordable, timely and accessible
- equitably and efficiently delivered.

^a See table 11A.11 for detailed footnotes and caveats.

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of public hospital services (figure 11.7). The performance indicator framework shows which data are complete and comparable in the 2016 Report. For data that are not considered directly comparable, text includes relevant caveats and supporting commentary. Chapter 1 discusses data comparability and data completeness from a Report-wide perspective (section 1.6).

This framework is also aligned with the National Healthcare Agreement (NHA), which covers the area of health and aged care. Performance indicators in this chapter are aligned with health indicators in the NHA, where relevant.

In addition to section 11.1, the Report's Statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

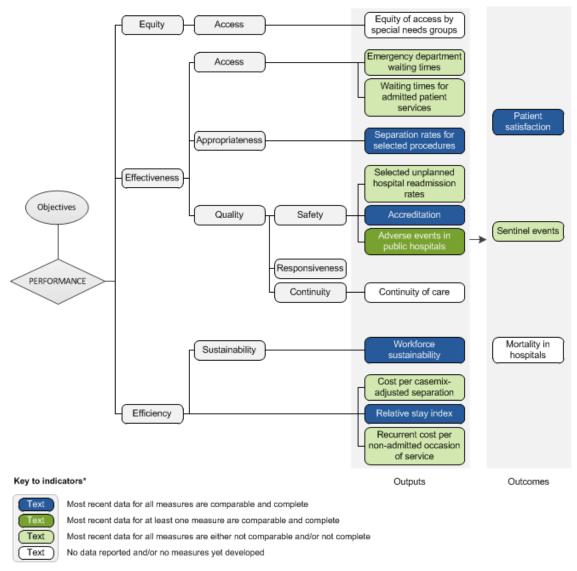

Figure 11.7 Public hospitals performance indicator framework

* A description of the comparability and completeness of each measure is provided in indicator interpretation boxes within the chapter

11.3 Key performance indicator results for public hospitals

Different delivery contexts, locations and types of client can affect the equity, effectiveness and efficiency of health services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

Equity indicators measure how well a service is meeting the needs of certain groups in society (see chapter 1). Public hospitals have a significant influence on the equity of the overall healthcare system. While access to public hospital services is important to the community in general, it is particularly important for people of low socioeconomic status (and others) who can have difficulty in accessing alternative services, such as those provided by private hospitals.

Access — Equity of access by special needs groups

'Equity of access by special needs groups' is an indicator of governments' objective to provide accessible services (box 11.2).

Box 11.2 Equity of access by special needs groups

'Equity of access by special needs groups' measures the performance of agencies providing services for identified special needs groups including: Aboriginal and Torres Strait Islander Australians; people living in communities outside the capital cities (that is, people living in other metropolitan areas, or rural and remote communities); and people from culturally and linguistically diverse backgrounds. Chapter 1 outlines special needs groups in more detail.

Equity of access by special needs groups has been identified as a key area for development in future Reports. Data for the emergency department waiting times and waiting times for admitted patient services indicators are reported by Indigenous status and remoteness.

Effectiveness

Access — Emergency department waiting times

'Emergency department waiting times' is an indicator of governments' objective to provide accessible services (box 11.3).

Box 11.3 **Emergency department waiting times**

'Emergency department waiting times' is defined by the following three measures:

- Emergency department waiting times by triage category
- · Emergency department waiting time to commencement of clinical care
- Length of stay for emergency department care, proportion of patients staying for four hours or less.

Data reported for all three measures for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Emergency department waiting times by triage category

'Emergency department waiting times by triage category' is defined as the proportion of patients seen within the benchmarks set by the Australasian Triage Scale. The Australasian Triage Scale is a scale for rating clinical urgency, designed for use in hospital-based emergency services in Australia and New Zealand.

The benchmarks, set according to triage category, are as follows:

- triage category 1: need for resuscitation patients seen immediately
- triage category 2: emergency patients seen within 10 minutes
- triage category 3: urgent patients seen within 30 minutes
- triage category 4: semi-urgent patients seen within 60 minutes
- triage category 5: non-urgent patients seen within 120 minutes.

A high or increasing proportion of patients seen within the benchmarks set for each triage category is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Emergency department waiting time to commencement of clinical care

'Emergency department waiting time to commencement of clinical care' is defined as the time elapsed for each patient from presentation in the emergency department to commencement of clinical care at the median and 90th percentile in minutes.

A low or decreasing Emergency department waiting time to commencement of clinical care is desirable.

Data quality information for this measure is under development.

(continued next page)

Box 11.3 (continued)

Length of stay for emergency department care, proportion of patients staying for four hours or less

'Length of stay for emergency department care, proportion of patients staying for four hours or less' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission, transfer or discharge is less than or equal to four hours. It is a measure of the duration of the emergency department service rather than a waiting time for emergency department care.

A high or increasing proportion of patients with a length of stay of four hours or less is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Emergency department waiting times by triage category

Nationally, in 2014-15, 100 per cent of patients in triage category 1 were seen within the clinically appropriate timeframe, and 79 per cent of patients in triage category 2 were seen within the clinically appropriate timeframe. For all triage categories combined, 74 per cent of patients were seen within triage category timeframes (table 11.2). Emergency department waiting times for peer group A and B hospitals are reported in table 11A.15.

The comparability of emergency department waiting times data across jurisdictions can be influenced by differences in data coverage (table 11.2) and clinical practices — in particular, the allocation of cases to urgency categories. The proportion of patients in each triage category who were subsequently admitted can indicate the comparability of triage categorisations across jurisdictions and thus the comparability of the waiting times data (table 11A.14).

Table 11.2 Emergency department patients seen within triage category timeframes, public hospitals (per cent, 2014-15)^a

| Triage category | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|------|
| 1 — Resuscitation | 100 | 100 | 99 | 100 | 100 | 100 | 100 | 100 | 100 |
| 2 — Emergency | 82 | 80 | 77 | 83 | 69 | 83 | 78 | 62 | 79 |
| 3 — Urgent | 76 | 73 | 64 | 57 | 57 | 64 | 48 | 54 | 68 |
| 4 — Semi-urgent | 81 | 73 | 74 | 69 | 69 | 67 | 53 | 59 | 74 |
| 5 — Non-urgent | 95 | 89 | 93 | 93 | 89 | 89 | 86 | 88 | 92 |
| Total | 81 | 75 | 71 | 68 | 66 | 70 | 59 | 60 | 74 |

^a See box 11.3 and table 11A.14 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), Emergency department care 2014-15: Australian hospital statistics. Health services series no. 65. Cat. no. HSE 168; table 11A.14.

Emergency department waiting times by Indigenous status, remoteness and socioeconomic status for public hospitals are reported in the attachment (tables 11A.16–18). Nationally, there was little difference between Aboriginal and Torres Strait Islander and other Australians in the percentages of patients treated within national benchmarks across the triage categories, although there were variations across states and territories for some triage categories (table 11A.16). At the national level, there was variation in waiting times across triage categories by remoteness, although there was less variation for the most serious category, resuscitation (table 11A.17). There was little difference in waiting times across triage categories by socioeconomic status on a national basis (table 11A.18).

Emergency department waiting time to commencement of clinical care

Median and 90th percentile waiting times to commencement of clinical care are reported in table 11.3. Nationally, emergency department patients had a median waiting time of 18 minutes, and 93 minutes at the 90th percentile (table 11.3).

Table 11.3 Emergency department patients waiting time to commencement of clinical care, public hospitals (minutes), 2014-15^a

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |
|------------------------------|-----|-----|-----|----|-----|-----|-----|-----|------|

Length of stay for emergency department care, proportion of patients staying for four hours or less

The proportion of patients staying for four hours or less in an emergency department has increased from 64.3 per cent in 2011-12 to 73.2 per cent in 2014-15 (figure 11.8).

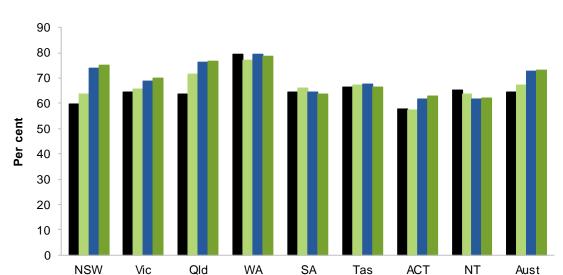

Figure 11.8 Length of stay for emergency department care, proportion of patients staying for four hours or less^a

2011-12 **2**012-13 **2**013-14 **2**014-15

Waiting times for admitted patient services

'Waiting times for admitted patient services' is an indicator of governments' objective to provide accessible services (box 11.4). Patients waiting longer are likely to suffer discomfort and inconvenience, and may experience poor health outcomes as a result.

Box 11.4 Waiting times for admitted patient services

'Waiting times for admitted patient services' is defined by the following four measures:

- Overall elective surgery waiting times
- · Elective surgery waiting times by clinical urgency category
- Presentations to emergency departments with a length of stay of 4 hours or less ending in admission
- Length of stay of emergency department presentations ending in admission.

(continued next page)

a See box 11.3 and table 11A.19 for detailed definitions, footnotes and caveats.

Box 11.4 (continued)

Data reported for these four measures are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Overall elective surgery waiting times

'Overall elective surgery waiting times' are calculated by comparing the date on which patients are added to a waiting list with the date on which they are admitted. Days on which the patient was not ready for care are excluded. 'Overall waiting times' are presented as the number of days within which 50 per cent of patients are admitted and the number of days within which 90 per cent of patients are admitted. The proportion of patients who waited more than 12 months is also shown.

For overall elective surgery waiting times, a low or decreasing number of days waited at the 50th and 90th percentiles, and a low or decreasing proportion of people waiting more than 365 days are desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Elective surgery waiting times by clinical urgency category

'Elective surgery waiting times by clinical urgency category' reports the proportion of patients who were admitted from waiting lists after an extended wait. The three generally accepted clinical urgency categories for elective surgery are:

- category 1 admission is desirable within 30 days for a condition that has the potential to deteriorate quickly to the point that it may become an emergency
- category 2 admission is desirable within 90 days for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency
- category 3 admission at some time in the future is acceptable for a condition causing
 minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and
 which does not have the potential to become an emergency. The desirable timeframe for
 this category is admission within 365 days.

The term 'extended wait' is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting more than the agreed desirable waiting times of 30 days and 90 days respectively.

For elective surgery waiting times by clinical urgency category, a low or decreasing proportion of patients who have experienced extended waits at admission is desirable. However, variation in the way patients are classified to urgency categories should be taken into account. Rather than comparing jurisdictions, the results for individual jurisdictions should be viewed in the context of the proportions of patients assigned to each of the three urgency categories (table 11.4).

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

(continued next page)

Box 11.4 (continued)

Presentations to emergency departments with a length of stay of 4 hours or less ending in admission

'Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission to hospital is less than or equal to four hours.

A high or increasing proportion of presentations to emergency departments with a length of stay of 4 hours or less ending in admission is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Length of stay of emergency department presentations ending in admission

'Length of stay of emergency department presentations ending in admission' is defined as the time from presentation of the patient to the emergency department to the time of admission to the hospital at the median and 90th percentile measured in hours and minutes by triage category.

A low or decreasing length of stay of emergency department presentations ending in admission is desirable.

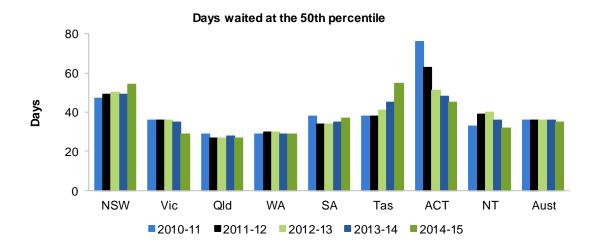

Data quality information for this measure is under development.

Overall elective surgery waiting times

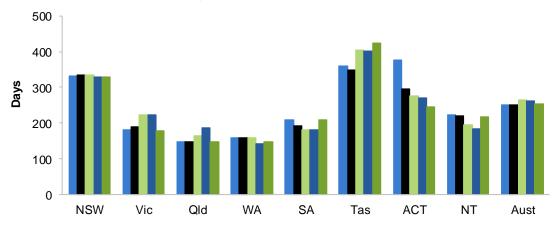

Nationally in 2014-15, 50 per cent of patients were admitted within 35 days and 90 per cent of patients were admitted within 253 days. The proportion of patients who waited more than a year was 1.8 per cent. Nationally, waiting times at the 50th percentile decreased by one day between 2010-11 and 2014-15, from 36 to 35 days. However, there were different trends for different jurisdictions and for different sized hospitals over that period (figure 11.9 and table 11A.21).

Patients on waiting lists who were not subsequently admitted to hospital are excluded. Patients can be removed from waiting lists because they no longer need the surgery, die, are treated at another location, decline to have the surgery, or cannot be contacted by the hospital (AIHW 2015a). In 2014-15, around 14 per cent of patients who were removed from waiting lists were removed for reasons other than admission for the awaited procedure (AIHW 2015a).

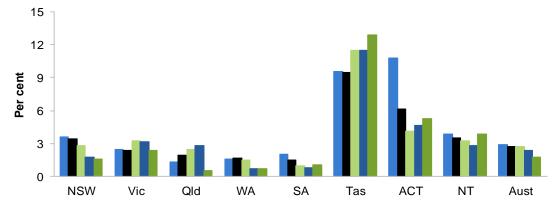

Figure 11.9 Waiting times for elective surgery, public hospitals^a

Days waited at the 90th percentile

Percentage who waited more than 365 days

 $[{]f a}$ See box 11.4 and table 11A.21 for detailed definitions, footnotes and caveats.

Source: AIHW (various years), Australian Hospital Statistics, Health Services Series, Cat no. HSE 117; AIHW (various years), Elective surgery waiting times: Australian hospital statistics, Cat. nos. HSE 127, 140, 151 and 166; table 11A.21.

Comparisons across jurisdictions should be made with caution, due to differences in clinical practices and classification of patients across Australia. The measures are also affected by variations across jurisdictions in the method used to calculate waiting times for patients who transferred from a waiting list managed by one hospital to a waiting list managed by another hospital. For patients who were transferred from a waiting list managed by one hospital to that managed by another, the time waited on the first list is included in the waiting time reported in NSW, WA, SA and the NT. This approach can have the effect of increasing the apparent waiting times for admissions in these jurisdictions compared with other jurisdictions (AIHW 2015a).

Attachment 11A includes data on elective surgery waiting times by hospital peer group, specialty of surgeon and indicator procedure. It also includes waiting times by Indigenous status, remoteness and socioeconomic status (tables 11A.21–26). Nationally, Aboriginal and Torres Strait Islander Australians had longer waiting times for elective surgery than other Australians at the 50th percentile and 90th percentile (table 11A.23). Those living in regional areas had longer waiting times than those in major cities at the 50th and 90th percentiles at the national level (table 11A.24). Elective surgery waiting times tended to increase with social disadvantage at the 50th and 90th percentiles on a national basis (table 11A.25).

Elective surgery waiting times by clinical urgency category

Elective surgery waiting times by urgency category not only provide an indication of the extent to which patients are seen within a clinically desirable time, but also draw attention to the variation in the way in which patients are classified across jurisdictions. Jurisdictional differences in the classification of patients by urgency category in 2014-15 are shown in table 11.4.

The system of urgency categorisation for elective surgery in public hospitals is important to ensure that priority is given to patients according to their needs. While elective surgery waiting times by urgency category are not comparable across jurisdictions, this measure has the advantage of providing an indication of the extent to which patients are seen within a clinically desirable time according to the urgency category to which they have been assigned.

The proportion of patients on waiting lists who already had an extended wait at the date of assessment are reported in tables 11A.28, 11A.30, 11A.32, 11A.34, 11A.36, 11A.38, 11A.40 and 11A.42. Waiting times data by urgency category and surgical speciality are also provided (tables 11A.29, 11A.31, 11A.33, 11A.35, 11A.37, 11A.39, 11A.41 and 11A.43).

Elective surgery waiting times by clinical urgency category, 2014-15 (per cent)^a Table 11.4

Presentations to emergency departments with a length of stay of 4 hours or less ending in admission

Nationally in 2014-15, 47 per cent of those who presented to an emergency department waited 4 hours or less to be admitted to hospital. Nationally, the percentage waiting 4 hours or less to be admitted was 56 per cent of patients requiring resuscitation, 48 per cent of emergency patients and 45 per cent of urgent patients (table 11.5).

Table 11.5 Proportion of presentations to emergency departments with a length of stay of 4 hours or less ending in admission, public hospitals, 2014-15^a

Source: AIHW (2015), Emergency department care 2014-15: Australian hospital statistics. Health services series no. 65. Cat. no. HSE 168; table 11A.44.

Nationally in 2014-15, a lower proportion of patients were admitted within 4 hours or less in large hospitals than in principal referral and women's and children's hospitals (table 11A.44).

Length of stay of emergency department presentations ending in admission

Median and 90th percentile lengths of stay of emergency department presentations ending in admission by triage category are reported in table 11.6. Patients requiring resuscitation tended to have shorter lengths of stay in the emergency department before being admitted than the other triage categories except for non-urgent cases (table 11.6).

Appropriateness — Separation rates for selected procedures

'Separation rates for selected procedures' is an indicator of the appropriateness of hospital services (box 11.5).

Box 11.5 Separation rates for selected procedures

'Separation rates for selected procedures' is defined as separations per 1000 people for certain procedures in all hospitals. The procedures are selected for their frequency, for sometimes being elective and discretionary, and because alternative treatments are sometimes available.

Higher/lower or increasing/decreasing rates are not necessarily associated with inappropriate care. However, large jurisdictional variations in rates for particular procedures can require investigation to determine whether service levels are appropriate.

Care needs to be taken when interpreting differences in the separation rates for the selected procedures. Variations in rates can be attributable to variations in the prevalence of the conditions being treated, or to differences in clinical practice across states and territories. Higher rates can be acceptable for certain conditions and not for others. Higher rates of angioplasties, for example, can represent appropriate levels of care, whereas higher rates of hysterectomies or tonsillectomies can represent an over-reliance on procedures. Some of the selected procedures, such as angioplasty and coronary artery bypass graft, are alternative treatment options for people diagnosed with similar conditions.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The separation rates for selected procedures reported here reflect the activities of the health system. For all procedures, separation rates varied across jurisdictions (table 11.7).

Table 11.7 Separations for selected procedures per 1000 people, 2013-14^a

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |

Quality

The aspects of quality highlighted in the performance indicator framework are safety, responsiveness and continuity. This Report includes indicators of safety, but no indicators have yet been developed for responsiveness or continuity.

Quality — Safety

Improving patient safety is an important issue for all hospitals. Studies on medical errors have indicated that adverse healthcare related events occur in public hospitals in Australia and internationally, and that their incidence is potentially high (for example, Eshani et al. 2006). These adverse events can result in serious consequences for individual patients, and the associated costs to individuals and the health care system can be considerable (Van den Bos et al. 2011).

Quality — Safety — Selected unplanned hospital readmission rates

'Selected unplanned hospital readmission rates' is an indicator of governments' objective to provide public hospital services that are safe and of high quality (box 11.6). Patients might be re-admitted unexpectedly if the initial care or treatment was ineffective or unsatisfactory, if post-discharge planning was inadequate, or for reasons outside the control of the hospital (for example poor post-discharge care).

Box 11.6 **Selected unplanned hospital readmission rates**

'Selected unplanned hospital readmission rates' is defined as the rate at which patients unexpectedly return to hospital within 28 days for further treatment of the same condition. It is calculated as the number of separations that were unplanned or unexpected readmissions to the same hospital following a separation in which a selected surgical procedure was performed and which occurred within 28 days of the previous date of separation, expressed per 1000 separations in which one of the selected surgical procedures was performed.

Selected surgical procedures are knee replacement, hip replacement, tonsillectomy and adenoidectomy, hysterectomy, prostatectomy, cataract surgery and appendectomy. Unplanned readmissions are those having a principal diagnosis of a post-operative adverse event for which a specified ICD-10-AM diagnosis code has been assigned.

Low or decreasing rates for this indicator are desirable. Conversely, high rates for this indicator suggest the quality of care provided by hospitals, or post-discharge care or planning, should be examined, because there may be scope for improvement.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Selected unplanned readmission rates are not adjusted for casemix or patient risk factors, which can vary across hospitals and across jurisdictions. Selected unplanned hospital readmission rates in public hospitals in 2013-14 are reported in table 11.8. Selected unplanned hospital readmission rates are reported by hospital peer group, Indigenous status, remoteness and socioeconomic status in table 11A.48.

There are some difficulties in identifying readmissions that were unplanned. The indicator is likely to be an under-estimate because:

- it identifies only those patients readmitted to the same hospital, so does not include patients who go to another hospital
- episodes of non-admitted patient care provided in outpatient clinics or emergency departments which may have been related to a previous admission are not included

• the unplanned and/or unexpected readmissions are limited to those having a principal diagnosis of a post-operative adverse event. This does not include all possible unplanned/unexpected readmissions.

Table 11.8 Selected unplanned hospital readmission rates, per 1000 separations, 2013-14^a

Quality — Safety — hospital accreditation

'Accreditation' is an indicator of governments' objective to provide public hospital services that are of high quality (box 11.7).

Box 11.7 Accreditation

'Accreditation' is defined by the following two measures:

- the proportion of accredited hospitals reported to the National Public Hospital Establishments Database
- the proportion of hospitals accredited to the National Safety and Quality Health Service standards. The standards are:
 - Governance for safety and quality in health service organisations
 - Partnering with consumers
 - Preventing and controlling healthcare associated infections
 - Medication safety
 - Patient identification and procedure matching

(continued next page)

Box 11.7 (continued)

- Clinical handover
- Blood and blood products
- Preventing and managing pressure injuries
- Recognising and responding to clinical deterioration in acute health care
- Preventing falls and harm from falls.

A high or increasing rate of accreditation is desirable. However, it is not possible to draw conclusions about the quality of care in those hospitals that do not have accreditation.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions but not over time. Data for 2013-14 are not comparable with prior years.
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Accredited hospitals reported to the National Public Hospital Establishments Database

The proportion of accredited public hospitals is reported in figure 11.10.

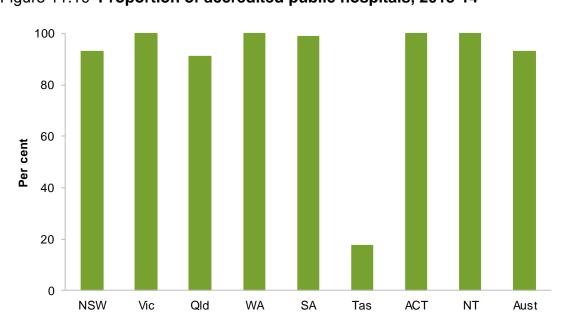

Figure 11.10 Proportion of accredited public hospitals, 2013-14a

Source: AIHW (2015), Hospital resources 2013-14: Australian hospital statistics. Health services series no. 63. Cat. no. HSE 160; table 11A.49.

^a See box 11.7 and table 11A.49 for detailed definitions, footnotes and caveats.

Accreditation is provided by a number of bodies, including the Australian Healthcare Standards' Evaluation and Quality Improvement Program, Business Excellence Australia, and the Quality Improvement Council. Hospitals can also be certified as compliant with the International Organization for Standardization's (ISO) 9000 quality family.

Hospitals accredited to the National Safety and Quality Health Service standards

Australian Health Ministers have mandated accreditation in all public and private hospitals and day procedure services in Australia from 1 January 2013. From this date health services are to be assessed to the National Safety and Quality Health Service (NSQHS) Standards by accrediting agencies approved by the ACSQHC. By 2016 it is anticipated all Australian hospitals will have been accredited to all 10 NSQHS standards. While the NSQHS standards started from January 2013, the proportion of hospitals that have been assessed to date varies between jurisdictions, as not all hospitals were due to be assessed as part of the routine 3-4 year cycle. The proportion of hospitals accredited to the National Safety and Quality Health Service standards are reported in table 11A.49.

Quality — Safety — adverse events in public hospitals

'Adverse events in public hospitals' is an indicator of governments' objective to provide public hospital services that are safe and of high quality (box 11.8). Adverse events in public hospitals can result in serious consequences for individual patients, place a significant burden on the health system and are influenced by the safety of hospital practices and procedures. Sentinel events, which are a subset of adverse events that result in death or very serious harm to the patient, are reported separately in this chapter as an outcome indicator.

Box 11.8 Adverse events in public hospitals

'Adverse events in public hospitals' is defined by the following three measures:

- selected healthcare-associated infections
- adverse events treated in hospitals
- falls resulting in patient harm in hospitals.

Selected healthcare-associated infections

'Selected healthcare-associated infections' is the number of *Staphylococcus aureus* (including Methicillin-resistant *Staphylococcus aureus* [MRSA]) bacteraemia (SAB) patient episodes associated with public hospitals, expressed as a rate per 10 000 patient days for public hospitals reporting for the SAB indicator.

(continued next page)

Box 11.8 (continued)

A patient episode of SAB is defined as a positive blood culture for SAB. Only the first isolate per patient is counted, unless at least 14 days has passed without a positive blood culture, after which an additional episode is recorded.

SAB is considered to be healthcare-associated if the first positive blood culture is collected more than 48 hours after hospital admission or less than 48 hours after discharge, or if the first positive blood culture is collected 48 hours or less after admission and one or more of the following key clinical criteria was met for the patient episode of SAB:

- SAB is a complication of the presence of an indwelling medical device
- SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site
- an invasive instrumentation or incision related to the SAB was performed within 48 hours
- SAB is associated with neutropenia (<1x109/L) contributed to by cytotoxic therapy.

Cases where a known previous blood culture has been obtained within the last 14 days are excluded. Patient days for unqualified newborns are included. Patient days for hospital boarders and posthumous organ procurement are excluded.

A low or decreasing rate of selected healthcare-associated infections is desirable.

Data reported for this measure are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Adverse events treated in hospitals

'Adverse events treated in hospitals' are incidents in which harm resulted to a person during hospitalisation. They are measured by separations that had an adverse event, including infections, falls resulting in injuries and problems with medication and medical devices that occurred during a hospitalisation. Hospital separations data include information on diagnoses, external causes of injury and poisoning, and their places of occurrence that can indicate that an adverse event was treated and/or occurred during the hospitalisation. However, other diagnosis codes may also suggest that an adverse event has occurred, and some adverse events are not identifiable using these codes.

Low or decreasing adverse events treated in hospitals is desirable.

Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

(continued next page)

Box 11.8 (continued)

Falls resulting in patient harm in hospitals

'Falls resulting in patient harm in hospitals' is defined as the number of separations with an external cause code for fall and a place of occurrence of health service area, expressed as a rate per 1000 hospital separations.

It is not possible to determine if the place of occurrence was a public hospital, only that it was a health service area.

A low or decreasing rate of falls resulting in patient harm in hospitals is desirable.

Data reported for this measure are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Selected healthcare-associated infections

Selected healthcare-associated infections in public hospitals per 10 000 patient days is reported in figure 11.11. The SAB patient episodes were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). The comparability of the SAB rates across jurisdictions and over time is limited, because of coverage differences and because the count of patient days reflects the amount of admitted patient activity, but does not necessarily reflect the amount of non-admitted patient activity.

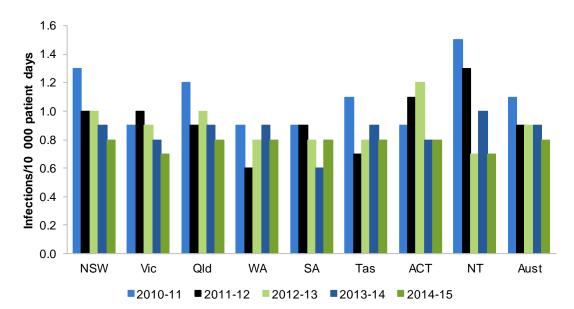

Figure 11.11 Selected healthcare-associated infections, public hospitals^a

Source: AIHW 2015 Staphylococcus aureus bacteraemia in Australian public hospitals 2014-15: Australian hospital statistics. Health services series. Cat. no. HSE 171; table 11A.50.

Adverse events treated in hospitals

In 2013-14, 6.7 per cent of separations in public hospitals reported an ICD-10-AM code indicating an adverse event (table 11.9). A separation may be recorded against more than one category in table 11.9, as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning).

These data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included in these tables may represent events that occurred before admission.

Some adverse events are not identifiable using the codes for an adverse event or a place of occurrence of hospital. Some other diagnosis codes may suggest that an adverse event has occurred when it has not.

^a See box 11.8 and table 11A.50 for detailed definitions, footnotes and caveats.

Falls resulting in patient harm in hospitals

Falls resulting in patient harm recorded in public hospital separations where the place of occurrence was a health service area varied across states and territories in 2013-14, with a national rate of 4.2 falls per 1000 separations (figure 11.12). Data are reported by Indigenous status and remoteness in table 11A.52.

Falls resulting in patient harm occurring in hospitals could be underestimated as the place of occurrence was not reported (or unspecified) for about 26 per cent of separations with an external cause of injury of falls (AIHW 2014).

Falls could also be overestimated, as it is not currently possible to identify falls specifically occurring in hospitals. Currently, the data identify falls occurring in any health service setting, including day surgery centres or hospices. However, to minimise the inclusion of falls that occurred before admission, separations with an injury or poisoning principal diagnosis are excluded.

Quality — Responsiveness

The Steering Committee has identified the responsiveness of public hospitals as an area for development in future Reports.

Quality — Continuity — continuity of care

'Continuity of care' is an indicator of governments' objective to provide public hospital services that are of high quality (box 11.9).

^a See box 11.8 and table 11A.52 for detailed definitions, footnotes and caveats.

Box 11.9 **Continuity of care**

'Continuity of care' measures the provision of uninterrupted, timely, coordinated healthcare, interventions and actions across programs, practitioners and organisations.

Continuity of care has been identified as a key area for development in future Reports.

Efficiency

Sustainability — Workforce sustainability

'Workforce sustainability' is an indicator of governments' objective to provide sustainable public hospital services (box 11.10). Labour, particularly nurses and medical practitioners, is the most significant and costly resource used in providing public hospital services (AIHW 2015d), and the sustainability of the workforce helps determine whether problems might arise in the future delivery of public hospital services.

Box 11.10 Workforce sustainability

'Workforce sustainability' reports age profiles for nurse and medical practitioner workforces. It shows the proportions of registered nurses and medical practitioners in ten year age brackets, by jurisdiction and by region.

High or increasing proportions of the workforce that are new entrants and/or low or decreasing proportions of the workforce that are close to retirement is desirable.

All nurses (including midwives) and medical practitioners in the workforce are included in these measures, as crude indicators of the potential respective workforces for public hospitals.

These measures are not a substitute for a full workforce analysis that allows for migration, trends in full-time work and expected demand increases. They can, however, indicate that further attention should be given to workforce sustainability for public hospitals.

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The sustainability of the public hospital workforce is affected by a number of factors; in particular, whether the numbers of new entrants are sufficient to maintain the existing workforce, and the proportion of the workforce that is close to retirement.

The age profile of the nursing workforce (which includes midwives) and the medical workforce for 2014 for each jurisdiction is shown in figures 11.13 and 11.14 respectively.

Nationally, 11.1 per cent of the nursing workforce and 17.2 per cent of the medical practitioner workforce were aged 60 years and over. Data disaggregated by remoteness area are available in tables 11A.53 (nursing) and 11A.55 (medical practitioner).

Efficiency

Two approaches to measuring the efficiency of public hospital services are included in this Report: the 'cost per casemix-adjusted unit of output' (the unit cost) and the 'casemix-adjusted relative length of stay index'. Length of stay is correlated with costs at aggregate levels of reporting.

The Steering Committee's approach is to report the full costs of a service where they are available. Where the full costs of a service cannot be accurately measured, the Steering Committee seeks to report estimated costs that are comparable. Where differences in comparability remain, the differences are documented. The Steering Committee has identified financial reporting issues that have affected the accuracy and comparability of unit costs for acute care services. These include the treatment of payroll tax, superannuation, depreciation and the user cost of capital associated with buildings and equipment. A number of issues remain to improve further the quality of these estimates.

Costs associated with non-current physical assets (such as depreciation and the user cost of capital) are potentially important components of the total costs of many services delivered by government agencies. Differences in the techniques for measuring non-current physical assets (such as valuation methods) can reduce the comparability of cost estimates across jurisdictions.

The results from a Steering Committee study examining different assessment measurement techniques (SCRCSSP 2001) found that for public hospitals the different methods could lead to quite large variations in reported capital costs. However, considered in the context of total unit costs, the differences created by these asset measurement effects were relatively small, because capital costs represent a small proportion of total cost (although the differences can affect cost rankings across jurisdictions). A key message from the study was that the adoption of nationally uniform accounting standards across all service areas would be a desirable outcome.

Care needs to be taken, therefore, in comparing unit costs across jurisdictions. Differences in counting rules, the treatment of various expenditure items (for example, superannuation) and the allocation of overhead costs have the potential to affect such comparisons. In addition, differences in the use of salary packaging can allow hospitals to lower their wage bills (and thus State or Territory government expenditure) while maintaining the after-tax income of their staff. No data were available for reporting on the effect of salary packaging and any variation in its use across jurisdictions.

Cost per casemix-adjusted separation

'Cost per casemix-adjusted separation' is an indicator of governments' objective to deliver services in a cost effective manner (box 11.11).

Box 11.11 Cost per casemix-adjusted separation

'Cost per casemix-adjusted separation' is defined by the following two measures:

- Recurrent cost per casemix-adjusted separation
- · Total cost per casemix-adjusted separation.

A low or decreasing recurrent or total cost per casemix-adjusted separation can reflect more efficient service delivery in public hospitals. However, this indicator needs to be viewed in the context of the set of performance indicators as a whole, as decreasing cost could also be associated with decreasing quality and effectiveness.

Recurrent cost per casemix-adjusted separation

'Recurrent cost per casemix-adjusted separation' is the average cost of providing care for an admitted patient (overnight stay or same day) adjusted with AR-DRG cost weights for the relative complexity of the patient's clinical condition and of the hospital services provided.

Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions but not over time. Data prior to 2013-14
 are not comparable with data after this time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is under development.

Total cost per casemix-adjusted separation

'Total cost per casemix adjusted separation' is calculated as capital, labour and material costs adjusted by the inpatient fraction, divided by the number of casemix-adjusted separations.

Capital costs include depreciation and the user cost of capital for buildings and equipment. This measure allows the full cost of hospital services to be considered. Depreciation is defined as the cost of consuming an asset's services. It is measured by the reduction in value of an asset over the financial year. The user cost of capital is the opportunity cost of the capital invested in an asset, and is equivalent to the return foregone from not using the funds to deliver other services or to retire debt. Interest payments represent a user cost of capital, so are deducted from capital costs to avoid double counting.

Results for this measure are not available this year.

Data quality information for this indicator is under development.

Recurrent cost per casemix-adjusted separation

'Recurrent cost per casemix-adjusted separation' data are presented in figure 11.15.

Total cost per casemix-adjusted separation

Results for this measure are not available this year. Capital costs are reported in table 11A.58 for 2013-14.

Relative stay index

NSW

Vic

'Relative stay index' is an indicator of governments' objective to deliver services efficiently (box 11.12). Data for this indicator are reported in figure 11.16.

^a See box 11.11 and table 11A.57 for detailed definitions, footnotes and caveats.
Source: IHPA (unpublished) National Hospital Cost Data Collection; table 11A.57.

Box 11.12 Relative stay index

'Relative stay index' is defined as the actual number of acute care patient days divided by the expected number of acute care patient days, adjusted for casemix. Casemix adjustment allows comparisons to take account of variation in types of service provided but not other influences on length of stay, such as the Indigenous status of the patient. Acute care separations only are included. Section 11.8 contains a more detailed definition outlining exclusions from the index.

The relative stay index for Australia for all hospitals (public and private) is one. A relative stay index greater than one indicates that average length of patient stay is higher than expected given the jurisdiction's casemix distribution. A relative stay index of less than one indicates that the number of bed days used was less than expected.

A low or decreasing relative stay index is desirable if it is not associated with poorer health outcomes or significant extra costs outside the hospital systems (for example, in home care).

States and territories vary in their thresholds for classifying patients as either same day admitted patients or outpatients. These variations affect the relative stay index.

Data reported for this measure are:

- · comparable (subject to caveats) across jurisdictions but not over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The relative stay index is reported by funding source and by medical, surgical and other AR-DRGs in tables 11A.59-60.

Figure 11.16 Relative stay index, public hospitals, 2013-14a

Source: AIHW (2015), Admitted patient care 2013-14: Australian hospital statistics. Health services series no. 60. Cat. no. HSE 156; table 11A.59.

Recurrent cost per non-admitted occasion of service

'Recurrent cost per non-admitted occasion of service' is an indicator of governments' objective to deliver services in a cost effective manner (box 11.13).

^a See box 11.12 and table 11A.59 for detailed definitions, footnotes and caveats.

Box 11.13 Recurrent cost per non-admitted occasion of service

Recurrent cost per non-admitted occasion of service' is defined as the proportion of recurrent expenditure allocated to patients who were not admitted, divided by the total number of non-admitted patient occasions of service in public hospitals. Occasions of service include examinations, consultations, treatments or other services provided to patients in each functional unit of a hospital. Non-admitted occasions of service (including emergency department presentations and outpatient services) account for a significant proportion of hospital expenditure.

A low or decreasing recurrent cost per non-admitted occasion of service can reflect more efficient service delivery in public hospitals. However, this indicator should be viewed in the context of the set of performance indicators as a whole, as decreasing cost could also be associated with decreasing quality and effectiveness. This indicator does not adjust for the complexity of service — for example, a simple urine glucose test is treated equally with a complete biochemical analysis of all body fluids (AIHW 2000).

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- incomplete for the current reporting period. All required data were not available for Victoria, Queensland and the NT.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

These data are not comparable across jurisdictions. Reporting categories vary across jurisdictions, and further inconsistencies arise as a result of differences in outsourcing practices. In some cases, for example, outsourced occasions of service can be included in expenditure on non-admitted services, but not in the count of occasions of service. Jurisdictions able to supply 2013-14 data for this indicator were NSW, WA, SA, Tasmania and the ACT, with data available in tables 11A.61–65.

Given the lack of a nationally consistent non-admitted patient classification system, this Report includes national data from the Independent Hospital Pricing Authority's National Hospital Cost Data Collection (NHCDC). The NHCDC collects data across a sample of hospitals that is expanding over time. The sample for each jurisdiction is not necessarily representative, because hospitals contribute data on a voluntary basis. The NHCDC data are affected by differences in costing and admission practices across jurisdictions and hospitals. Therefore, an estimation process has been carried out to create representative national activity figures from the sample data. In addition, the purpose of the NHCDC is to calculate between-DRG cost weights, not to compare the efficiency of hospitals.

The emergency department cost per presentation in 2013-14 was \$584 nationally (table 11A.66). Wages and salaries accounted for around two thirds of this average cost nationally (table 11A.66). Emergency department costs per presentation by urgency related grouping are reported in table 11A.67 for the period 2011-12 to 2013-14 on a national basis. Non-admitted service events had an average cost of \$282 in 2013-14 nationally (table 11A.68).

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5).

Patient satisfaction

'Patient satisfaction' provides a proxy measure of governments' objective to deliver services that are high quality and responsive to individual patient needs (box 11.14).

Box 11.14 Patient satisfaction

'Patient satisfaction' is defined by the following six measures for the purposes of this report:

- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' listened carefully to them
- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' showed respect to them
- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' spent enough time with them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' listened carefully to them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' showed respect to them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' spent enough time with them.

A high or increasing proportion of patients who were satisfied is desirable, because it suggests the hospital care received was of high quality and better met the expectations and needs of patients.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time.
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

The Patient Experience Survey does not include people living in discrete Indigenous communities and very remote areas, which affects the comparability of the NT results.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Patient satisfaction surveys are different from other sources of hospital quality data, because they provide information on hospital quality from the patient's perspective.

Surveys can be useful for obtaining information on patient views of both clinical and non clinical hospital care (such as whether patients feel they were treated with respect and provided with appropriate information regarding their treatment).

Patient satisfaction data for emergency department and admitted hospital patients are reported in table 11.10. Relative standard errors and confidence intervals are reported in attachment tables 11A.69–76. These tables also report patient satisfaction by remoteness.

Sentinel events

'Sentinel events' is an indicator of governments' objective to deliver public hospital services that are safe and of high quality (box 11.15). Sentinel events can indicate hospital

system and process deficiencies that compromise quality and safety. Sentinel events are a subset of adverse events that result in death or very serious harm to the patient. Adverse events are reported elsewhere in this chapter as an output indicator.

Box 11.15 Sentinel events

'Sentinel events' is defined as the number of reported adverse events that occur because of hospital system and process deficiencies, and which result in the death of, or serious harm to, a patient. Sentinel events occur relatively infrequently and are independent of a patient's condition. Sentinel events have the potential to seriously undermine public confidence in the healthcare system.

Australian health ministers have agreed on a national core set of sentinel events for which all public hospitals are required to provide data. The eight nationally agreed core sentinel events are:

- 1. Procedures involving the wrong patient or body part resulting in death or major permanent loss of function.
- 2. Suicide of a patient in an inpatient unit.
- 3. Retained instruments or other material after surgery requiring re-operation or further surgical procedure.
- 4. Intravascular gas embolism resulting in death or neurological damage.
- 5. Haemolytic blood transfusion reaction resulting from ABO (blood group) incompatibility.
- 6. Medication error leading to the death of a patient reasonably believed to be due to incorrect administration of drugs.
- 7. Maternal death associated with pregnancy, birth or the puerperium.
- 8. Infant discharged to the wrong family.

A low or decreasing number of sentinel events is desirable.

Over time, an increase in the number of sentinel events reported might reflect improvements in incident reporting mechanisms and organisational cultural change, rather than an increase in the frequency of such events. However, trends need to be monitored to establish whether this is the underlying reason.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Sentinel event programs have been implemented by all State and Territory governments. The purpose of these programs is to facilitate a safe environment for patients by reducing the frequency of these events. The programs are not punitive, and are designed to facilitate self-reporting of errors so that the underlying causes of the events can be examined, and action taken to reduce the risk of these events re-occurring.

Numbers of sentinel events for 2013-14 are reported below. As larger states and territories will tend to have more sentinel events than smaller jurisdictions, the numbers of separations and individual occasions of service are also presented to provide context.

In 2013-14:

- In NSW public hospitals there was a total of 53 sentinel events (table 11A.77) compared to around 1.8 million separations (table 11A.6) and around 25.3 million individual occasions of service (table 11A.13).
- In Victorian public hospitals there was a total of 20 sentinel events (table 11A.78) compared to around 1.5 million separations (table 11A.6). Victoria did not report any individual occasions of service (table 11A.13).
- In Queensland public hospitals there was a total of 12 sentinel events (table 11A.79) compared to around 1.1 million separations (table 11A.6) and around 10.4 million individual occasions of service (table 11A.13).
- In WA public hospitals there was a total of 9 sentinel events (table 11A.80) compared to around 596 000 separations (table 11A.6) and around 5.9 million individual occasions of service (table 11A.13).
- In SA public hospitals there was a total of 6 sentinel events (table 11A.81) compared to around 416 000 separations (table 11A.6) and around 2.0 million individual occasions of service (table 11A.13).
- In Tasmanian public hospitals there were no reported sentinel events (table 11A.82) compared to around 114 000 separations (table 11A.6) and around 560 000 individual occasions of service (table 11A.13).
- In ACT public hospitals there were no reported sentinel events (table 11A.83). There were around 97 000 separations (table 11A.6) and around 1.7 million individual occasions of service (table 11A.13).
- In NT public hospitals in 2013-14, there was a total of 2 sentinel events (table 11A.84) compared to around 124 000 separations (table 11A.6) and around 603 000 individual occasions of service (table 11A.13).

Data for 2009-10 to 2013-14 are reported in tables 11A.77–84, along with disaggregation by the type of sentinel event. Australian totals are reported in table 11A.85.

Mortality in hospitals

'Mortality in hospitals' is an indicator of governments' objective to deliver public hospital services that are safe and of high quality (box 11.16).

Box 11.16 Mortality in hospitals

'Mortality in hospitals' is defined by the following three measures:

- Hospital standardised mortality ratio
- · Death in low-mortality diagnostic related groups
- In-hospital mortality rates.

Mortality in hospitals has been identified as a key area for development in future Reports.

11.4 Profile of maternity services

Maternity services (defined as AR-DRGs relating to pregnancy, childbirth and the puerperium, and newborns and other neonates) accounted for 8.3 per cent of total acute separations in public hospitals (table 11A.87) and around 10.6 per cent of the total cost of all acute separations in public hospitals in 2013-14 (table 11A.86). Figure 11.17 shows the rate of acute separations per 1000 people for maternity services in 2013-14.

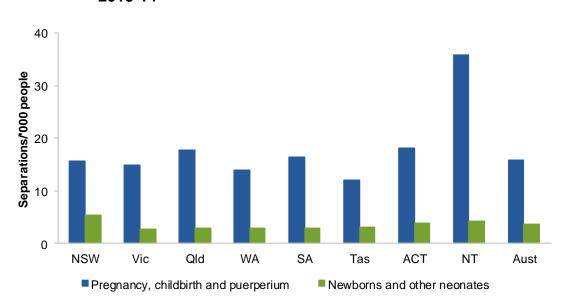

Figure 11.17 Separation rates for maternity services, public hospitals, 2013-14^a

Source: AIHW (unpublished), National Hospital Morbidity Database; ABS (unpublished), Australian Demographic Statistics, December Quarter 2013, Cat. no. 3101.0; tables 2A.2 and 11A.87.

In Australian public hospitals in 2013-14, 41.1 per cent of the separations for pregnancy, childbirth and the puerperium had a DRG of vaginal delivery (tables 11A.87 and 11A.88). The cost of vaginal deliveries was \$780.5 million in 2013-14 (table 11A.88).

^a See table 11A.87 for detailed footnotes and caveats.

The complexity of maternity services is partly related to the mother's age at the time of giving birth. The mean age of mothers giving birth varied across jurisdictions (table 11.11).

Table 11.11 Mean age of mothers at time of giving birth, public hospitals^a NSW Vic Qld WA SA Tas ACT NT 2010 First birth 27.6 28.4 25.6 26.3 27.1 25.3 28.0 24.6 Second birth 29.8 30.8 28.2 28.8 29.6 26.4 30.4 27.1 Third birth 30.3 31.1 32.1 29.8 31.3 31.9 28.9 28.9 All births 29.4 30.2 28.4 29.2 28.0 29.9 27.0 28.0 2011 First birth 27.7 28.4 25.9 26.5 27.3 25.9 28.4 24.7 Second birth 29.9 30.7 28.2 28.8 29.8 28.5 30.6 27.2 Third birth 31.1 32.2 30.1 30.4 31.3 32.2 29.8 28.7 All births 29.4 28.5 29.3 30.0 30.2 28.1 28.1 27.1 2012 First birth 27.7 28.6 26.0 26.6 27.3 25.9 28.3 24.8 Second birth 29.9 30.9 28.4 28.9 29.8 28.4 30.7 27.4 Third birth 31.3 32.2 30.3 29.9 31.3 30.3 31.8 28.8 All births 29.5 30.3 28.2 28.5 29.3 28.2 29.9 27.2 2013 First birth 28.0 28.8 26.9 27.6 26.1 28.7 26.1 25.2 Second birth 30.0 30.9 28.4 29.1 30.0 28.6 30.9 27.9 Third birth 31.2 32.2 29.9 30.4 31.2 29.9 32.4 29.7 All births 29.6 30.4 28.2 28.7 29.4 28.2 30.3 27.6 2014 First birth 28.2 28.9 26.4 27.2 27.8 26.4 28.7 25.5 Second birth 30.1 31.0 28.6 29.3 30.0 28.4 31.0 28.2

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of maternity services (figure 11.18). The performance indicator framework shows which data are complete and

a See table 11A.89 for detailed footnotes and caveats.

comparable in the 2016 Report. For data that are not considered directly comparable, text includes relevant caveats and supporting commentary. Chapter 1 discusses data comparability and data completeness from a Report-wide perspective (section 1.6). The Health sector overview explains the performance indicator framework for health services as a whole, including the subdimensions of quality and sustainability that have been added to the standard Review framework.

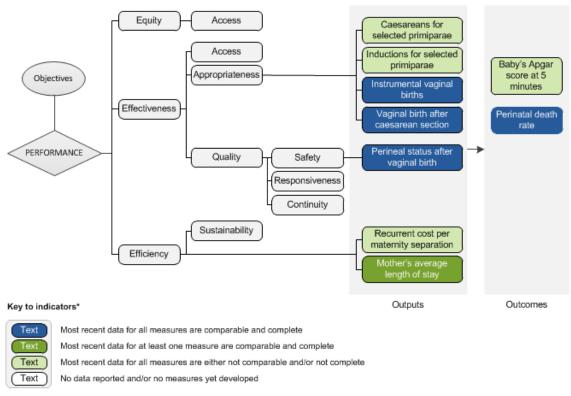

Figure 11.18 Maternity services performance indicator framework

* A description of the comparability and completeness of each measure is provided in indicator interpretation boxes within the chapter

In addition to section 11.1 and 11.4, the Report's Statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

11.6 Key performance indicator results for maternity services

Different delivery contexts, locations and types of client can affect the equity, effectiveness and efficiency of health services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about

quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

The Steering Committee has identified equity of access as an area for development in future Reports. Equity of access indicators will measure access to maternity services by special needs groups such as Aboriginal and Torres Strait Islander Australians or people in rural and remote areas.

Effectiveness

Access

The Steering Committee has identified the effectiveness of access to maternity services as an area for development in future Reports. Effectiveness of access indicators will measure access to appropriate services for the population as a whole, particularly in terms of affordability and/or timeliness.

Appropriateness — Caesareans and inductions for selected primiparae

'Caesareans for selected primiparae' and 'Inductions for selected primiparae' are indicators of the appropriateness of maternity services in public hospitals (box 11.17).

Box 11.17 Caesareans and inductions for selected primiparae^a

'Caesareans and inductions for selected primiparae' are defined as the number of inductions or caesareans for the selected primiparae^a divided respectively by the number of the selected primiparae who gave birth.

The indicator is calculated for women aged between 20 and 34 years who have had no previous deliveries, with a singleton baby with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks. This group is considered to be low risk parturients b so caesarean or induction rates should be low in their population.

High intervention rates can indicate a need for investigation, although labour inductions and birth by caesarean section are interventions that are appropriate in some circumstances, depending on the health and wellbeing of mothers and babies.

Data reported for this indicator are:

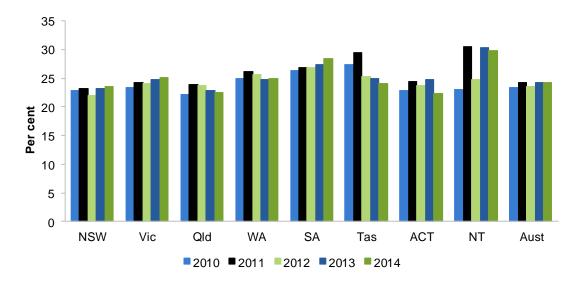

- comparable (subject to caveats) within jurisdictions and over time but are not comparable across jurisdictions and are not comparable with data in previous report editions
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

a Primiparae refers to a woman who has given birth to a liveborn or stillborn infant for the first time.
b Parturient means 'about to give birth'.

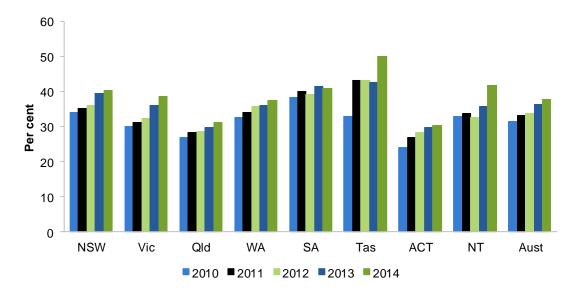

Caesarean rates for selected primiparae in public hospitals are reported in figure 11.19. Induction rates for selected primiparae in public hospitals are reported in figure 11.20. Caesarean and induction rates for private hospitals are shown in table 11A.90 for comparison. Data for all jurisdictions for earlier years are included in tables 11A.91–98.

Figure 11.19 Caesareans for selected primiparae, public hospitals^a

^a See box 11.17 and tables 11A.91–98 for detailed definitions, footnotes and caveats. *Source*: State and Territory governments (unpublished); tables 11A.91–98.

Figure 11.20 Inductions for selected primiparae, public hospitals^a

^a See box 11.17 and tables 11A.91–98 for detailed definitions, footnotes and caveats. *Source*: State and Territory governments (unpublished); tables 11A.91–98.

Instrumental vaginal births

'Instrumental vaginal births' is an indicator of the appropriateness of maternity services (box 11.18).

Box 11.18 Instrumental vaginal births

'Instrumental vaginal births' is defined as the number of selected primiparas^a who had an instrumental vaginal birth as a percentage of all selected primiparas that gave birth. Instrumental vaginal births includes the use of forceps and vacuum extraction.

The indicator is calculated for women aged between 20 and 34 years who have had no previous deliveries, with a singleton baby with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks.

While low or decreasing instrumental vaginal births can be desirable, a high rate does not necessarily indicate inappropriate care. Reasons for instrumental vaginal births often include:

- the first baby/birth of the mother
- · the baby was becoming distressed during birth
- · the baby was not moving down through the birth canal
- there was a medical reason why the mother should or could not push.

In these cases, the use of instruments is often necessary and appropriate and can often have a better outcome for mother and baby than a caesarean section. A low or decreasing rate of instrumental vaginal births could be undesirable in situations such as this if there is a corresponding increase in the rate of caesarean sections.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

^a Primiparas refers to women who have given birth to a liveborn or stillborn infant for the first time.

In 2013 across Australia, 47.1 per cent of women giving birth for the first time gave birth without the assistance of instruments, while 25.3 per cent gave birth with the use of instruments and 27.5 per cent had a caesarean section. There was significant variation across states and territories (figure 11.21).

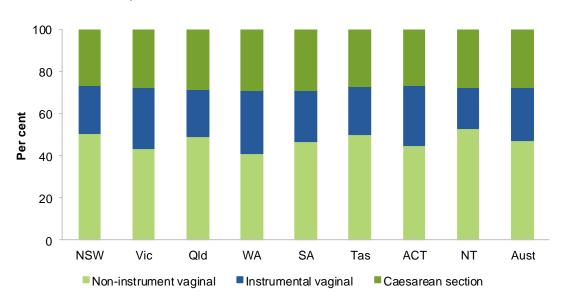

Figure 11.21 Method of birth for selected women giving birth for the first time, 2013^a

Vaginal birth after caesarean section

'Vaginal birth after caesarean section' is an indicator of the appropriateness of maternity services (box 11.19).

Box 11.19 Vaginal birth after caesarean section

'Vaginal birth after caesarean section' is defined as the percentage of multiparous^a mothers who have had a previous caesarean, whose current method of birth was either an instrumental or non-instrumental vaginal birth.

Interpretation of this indicator is ambiguous. There is ongoing debate about the relative risks of a repeat caesarean section or vaginal birth following a caesarean section. The decision should always be based on clinical assessment. Low rates of vaginal birth following a caesarean may warrant investigation, or on the other hand, they can indicate appropriate clinical caution. When interpreting this indicator, emphasis needs to be given to the potential for improvement.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

(continued next page)

^a See box 11.18 and table 11A.99 for detailed definitions, footnotes and caveats. *Source*: AIHW (unpublished) National Perinatal Data Collection; table 11A.99.

Box 11.19 (continued)

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2013, 15.4 per cent of women had either an instrumental or non-instrumental vaginal delivery after a caesarean section, while 84.6 per cent had another caesarean section (figure 11.22 and table 11A.100).

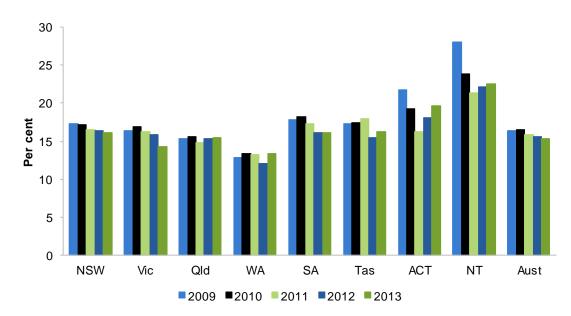

Figure 11.22 Women who had a vaginal birth after a caesarean sectiona

Quality

The performance indicator framework for maternity services identifies three subdimensions of quality for health services: safety; responsiveness and continuity. For maternity services in this Report, data are reported against the subdimension of safety only. Other subdimensions of quality have been identified by the Steering Committee for future development.

^a Multiparous means a woman who has given birth from at least two pregnancies that each resulted in a live birth or stillbirth.

^a See box 11.19 and table 11A.100 for detailed definitions, footnotes and caveats.

Source: Li, Z., McNally, L., Hilder, L. and Sullivan, EA. (various years), Australia's mothers and babies, Perinatal statistics series; table 11A.100.

Quality — Safety — perineal status after vaginal birth

'Perineal status after vaginal birth' is an indicator of governments' objective to provide safe and high quality services (box 11.20). Perineal lacerations caused by childbirth are painful, take time to heal and can result in ongoing discomfort and debilitating conditions such as faecal incontinence.

Box 11.20 Perineal status after vaginal birth

'Perineal status after vaginal birth' is defined as the state of the perineum following a vaginal birth. A third or fourth degree laceration is a perineal laceration or rupture (or tear following episiotomy) extending to, or beyond, the anal sphincter (see section 11.8 for definitions) (NCCH 2008). It is measured by the proportion of women giving birth with third or fourth degree lacerations to their perineum following vaginal birth.

A low or decreasing rate of women giving birth with third or fourth degree lacerations after vaginal birth is desirable. Maternity services staff aim to minimise lacerations, particularly more severe lacerations (third and fourth degree), through labour management practices. Severe lacerations (third and fourth degree laceration) of the perineum are not avoidable in all cases and so safe labour management is associated with a low (rather than zero) proportion of third or fourth degree lacerations.

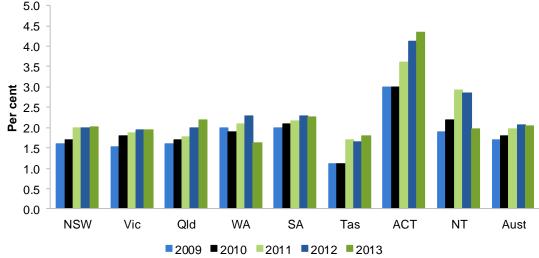

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The proportion of mothers with third or fourth degree lacerations to their perineum following vaginal births is shown in figure 11.23. More information on perineal status after vaginal birth (including the proportion of mothers with intact perineum following vaginal births) is contained in table 11A.101.

Figure 11.23 Perineal status — mothers with third or fourth degree lacerations after vaginal births^a

^a See box 11.20 and table 11A.101 for detailed definitions, footnotes and caveats.

Source: Li, Z., McNally, L., Hilder, L. and Sullivan, EA. (various years), Australia's mothers and babies, Perinatal statistics series; table 11A.101.

Efficiency

Sustainability

The Steering Committee has identified the sustainability of maternity services as an area for development in future Reports.

Recurrent cost per maternity separation

'Recurrent cost per maternity separation' is an indicator of governments' objective to deliver cost effective services (box 11.21).

Box 11.21 Recurrent cost per maternity separation

Recurrent cost per maternity separation' is presented for the two AR-DRGs that account for the largest number of maternity patient days: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery without catastrophic or severe complications and comorbidities.

Low or decreasing recurrent costs per maternity separation can reflect high or increasing efficiency in providing maternity services to admitted patients. However, this is only likely to be the case where the low cost maternity services are provided at equal or superior effectiveness.

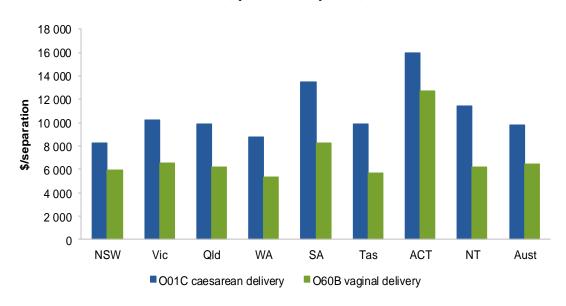

Data reported for this indicator are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Data are reported for the two most common maternity AR-DRGs: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery without catastrophic or severe complications and comorbidities (figure 11.24).

Figure 11.24 Estimated average cost per separation for selected maternity related AR-DRGs, public hospitals, 2013-14^a

a See box 11.21 and table 11A.102 for detailed definitions, footnotes and caveats.Source: IHPA (unpublished), National Hospital Cost Data Collection; table 11A.102.

Average cost is affected by a number of factors including admission practices, sample size, remoteness and the types of hospital contributing to the collection. Caution must be used in making direct comparisons across jurisdictions, because of differences in hospital costing systems.

Data for a number of other maternity related AR-DRGs are shown in table 11A.102. Data are sourced from the NHCDC. The NHCDC is a voluntary annual collection, the purpose of which is to calculate DRG cost weights. The samples are not necessarily representative of the set of hospitals in each jurisdiction. An estimation process has been carried out to create representative national activity figures from the sample data.

Mother's average length of stay

'Mother's average length of stay' is an indicator of governments' objective to deliver services efficiently (box 11.22).

Box 11.22 Mother's average length of stay

'Mother's average length of stay' is defined as the total number of patient days for the selected maternity AR-DRG, divided by the number of separations for that AR-DRG.

Shorter stays for mothers reduce hospital costs but whether they represent genuine efficiency improvements depends on a number of factors. Shorter stays can, for example, have an adverse effect on the health of some mothers and result in additional costs for in-home care and potential readmissions. The indicator is not adjusted for multiple births born vaginally and without complications but requiring a longer stay to manage breastfeeding.

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Data are reported for two selected maternity AR-DRGs: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery single uncomplicated (figure 11.25). Nationally in 2013-14, the average length of stay in public hospitals was 3.5 days for caesarean delivery and 2.2 days for vaginal delivery. Data are available for private hospitals in table 11A.103.

5 4 3 Days 2 1 0 NSW Vic Qld WA SA ACT NT Tas Aust

O60C vaginal delivery

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5).

Baby's Apgar score

'Baby's Apgar score at five minutes' is an indicator of governments' objective to deliver maternity services that are safe and of high quality (box 11.23). The future health of babies with lower Apgar scores is often poorer than those with higher scores.

^a See box 11.22 and table 11A.103 for detailed definitions, footnotes and caveats.

Box 11.23 Baby's Apgar score at five minutes

Baby's Apgar score at five minutes is defined as the number of live births with an Apgar score of less than 4, at 5 minutes post-delivery, as a proportion of the total number of live births by specified birthweight categories. The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability. Between 0 and 2 points are given for each of these five characteristics and the total score is between 0 and 10. The Apgar score is routinely assessed at 1 and 5 minutes after birth, and subsequently at 5 minute intervals if it is still low at 5 minutes.

A high or increasing Apgar score is desirable.

Low Apgar scores (defined as less than 4) are strongly associated with low birthweights. The management of labour in hospitals does not usually affect birthweights, but can affect the prevalence of low Apgar scores for babies with similar birthweights. Apgar scores can therefore indicate relative performance within birthweight categories, although factors other than hospital maternity services can influence Apgar scores within birthweight categories — for example, antenatal care, multiple births and socioeconomic factors.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

'Low' (less than 4) Apgar scores for babies by birthweight category are reported in table 11.12. The full range of Apgar scores for 2005 to 2014 are reported in table 11A.104.

Table 11.12 Live births with an Apgar score of less than 4, 5 minutes post delivery, public hospitals, 2014^a

Perinatal death rate

'Perinatal death rate' is an indicator of governments' objective to deliver maternity services that are safe and of high quality (box 11.24).

Box 11.24 Perinatal death rate

'Perinatal death rate' is defined by the following three measures:

- Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants weighing at least 400 grams or of a gestational age of at least 20 weeks. The fetal death rate is calculated as the number of fetal deaths divided by the total number of births (live births and fetal deaths combined). The rate of fetal deaths is expressed per 1000 total births, by State or Territory of usual residence of the mother.
- Neonatal death is the death of a live born infant within 28 days of birth (see section 11.8 for a definition of a live birth). The neonatal death rate is calculated as the number of neonatal deaths divided by the number of live births registered. The rate of neonatal deaths is expressed per 1000 live births, by State or Territory of usual residence of the mother.
- A perinatal death is a fetal or neonatal death. The perinatal death rate is calculated as the number of perinatal deaths divided by the total number of births (live births and fetal deaths combined). It is expressed per 1000 total births, by State or Territory of usual residence of the mother.

Low or decreasing death rates are desirable and can indicate high quality maternity services. The neonatal death rate tends to be higher among premature babies, so a lower neonatal death rate can also indicate a lower percentage of pre-term births.

Differences in the fetal death rate across jurisdictions are likely to be due to factors outside the control of admitted patient maternity services (such as the health of mothers and the progress of pregnancy before hospital admission). To the extent that the health system influences fetal death rates, the health services that can have an influence include outpatient services, general practice services and maternity services. In jurisdictions where the number of fetal deaths is low, small annual fluctuations in the number affect the annual rate of fetal deaths.

As for fetal deaths, a range of factors contribute to neonatal deaths. However, the influence of maternity services for admitted patients is greater for neonatal deaths than for fetal deaths, through the management of labour and the care of sick and premature babies.

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Fetal death rate

Fetal death rates are reported in figure 11.26. Nationally, fetal death rates have been steady over the period 2009–2013. National time series for fetal death rates for the period 2004 to

2013 are included in table 11A.107. Fetal deaths data by the Indigenous status of the mother are available in table 11A.109 for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of identification of Aboriginal and Torres Strait Islander people in mortality data.

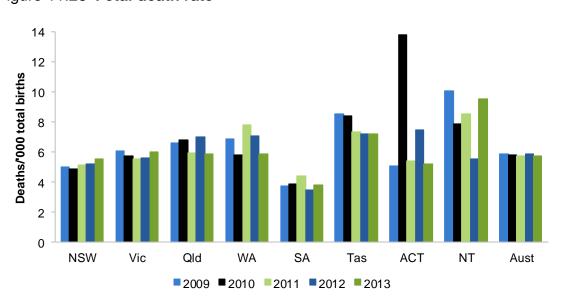

Figure 11.26 Fetal death rate^a

Neonatal death rate

Neonatal death rates are reported in figure 11.27. Nationally, neonatal death rates have declined over the period 2009–2013. National time series for neonatal death rates for the period 2004 to 2013 are included in table 11A.107. Neonatal deaths data by the Indigenous status of the mother are available in table 11A.109 for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of identification of Aboriginal and Torres Strait Islander people in mortality data.

11.7 Future directions in performance reporting

Priorities for future reporting on public hospitals and maternity services include the following:

- Improving the comprehensiveness of reporting by filling in gaps in the performance
 indicator frameworks. Important gaps in reporting for public hospitals include
 indicators of equity of access to services for special needs groups, and indicators of
 continuity of care. Gaps in the maternity services framework include equity of access,
 effectiveness of access, two aspects of quality responsiveness and continuity and
 the efficiency subdimension of sustainability.
- Improving currently reported indicators for public hospitals and maternity services where data are not complete or not directly comparable. There is scope to improve reporting of the quality and access dimensions of the public hospitals framework, and the output indicators for maternity services.
- Improving the reporting of elective surgery waiting times by urgency category to achieve greater comparability across jurisdictions and improving timeliness of the data.
- Improving the reporting of quality and safety indicators in both the public hospitals' and maternity services' frameworks.

Definitions of key terms 11.8

Accreditation Professional recognition awarded to hospitals and other healthcare facilities

> that meet defined industry standards. Public hospitals can seek accreditation through the ACHS Evaluation and Quality Improvement Program, the Australian Quality Council (now known as Business Excellence Australia), the Quality Improvement Council, the International Organisation for Standardization 9000 Quality Management System or other equivalent

programs.

Acute care Clinical services provided to admitted or non-admitted patients, including

> managing labour, curing illness or treating injury, performing surgery, relieving symptoms and/or reducing the severity of illness or injury, and performing diagnostic and therapeutic procedures. Most episodes involve a

relatively short hospital stay.

Admitted patient A patient who has undergone a formal admission process in a public hospital

to begin an episode of care. Admitted patients can receive acute, subacute

or non-acute care services.

Admitted patient cost

proportion

The ratio of admitted patient costs to total hospital costs, also known as the inpatient fraction.

Allied health (non-admitted)

Occasions of service to non-admitted patients at units/clinics providing treatment/counselling to patients. These include units providing physiotherapy, speech therapy, family planning, dietary advice, optometry

and occupational therapy.

Apgar score Numerical score used to evaluate a baby's condition after birth. The

> definition of the reported indicator is the number of babies born with an Apgar score of 3 or lower at 5 minutes post delivery, as a proportion of the total number of babies born. Excludes fetal deaths in utero before

commencement of labour.

AR-DRG Australian Refined Diagnosis Related Group - a patient classification system

that hospitals use to match their patient services (hospital procedures and diagnoses) with their resource needs. AR-DRG version 6.0x is based on the

ICD-10-AM classification.

Australian Classification of **Health Interventions**

(ACHI)

ACHI is the Australian classification of health interventions.

Average length of stay

The mean length of stay for all patient episodes, calculated by dividing total

occupied bed days by total episodes of care.

Caesarean section

Operative birth through an incision into abdomen and uterus.

Casemix adjusted

Adjustment of data on cases treated to account for the number and type of cases. Cases are sorted by AR-DRG into categories of patients with similar clinical conditions and requiring similar hospital services. Casemix adjustment is an important step to achieving comparable measures of

efficiency across hospitals and jurisdictions.

Casemix adjusted separations

The number of separations adjusted to account for differences across

hospitals in the complexity of episodes of care.

Catastrophic

An acute or prolonged illness usually considered to be life threatening or with the threat of serious residual disability. Treatment can be radical and is

frequently costly.

Community health

services

Health services for individuals and groups delivered in a community setting, rather than via hospitals or private facilities.

Comparability

Data are considered comparable if, (subject to caveats) they can be used to inform an assessment of comparative performance. Typically, data are considered comparable when they are collected in the same way and in accordance with the same definitions. For comparable indicators or

measures, significant differences in reported results allow an assessment of

differences in performance, rather than being the result of anomalies in the data.

Completeness Data are considered complete if all required data are available for all

jurisdictions that provide the service.

Cost of capital The return foregone on the next best investment, estimated at a rate of

8 per cent of the depreciated replacement value of buildings, equipment and

land. Also called the 'opportunity cost' of capital.

Cost per casemix adjusted separation

Recurrent expenditure multiplied by the inpatient fraction and divided by the total number of casemix-adjusted separations plus estimated private patient

medical costs.

Cost per non-admitted occasion of service

Recurrent expenditure divided by the inpatient fraction and divided by the total number of non-admitted occasions of service.

total number of non-admitted occasions of service

Elective surgery waiting times Elective surgery waiting times are calculated by comparing the date on which patients are added to a waiting list with the date on which they are admitted for the awaited procedure. Days on which the patient was not ready for care are excluded.

Emergency department waiting time to commencement of

clinical care

The time elapsed for each patient from presentation to the emergency department (that is, the time at which the patient is clerically registered or triaged, whichever occurs earlier) to the commencement of service by a treating medical officer or nurse.

Emergency department waiting times to admission

The time elapsed for each patient from presentation to the emergency department to admission to hospital.

Episiotomy A surgical incision into the perineum and vagina that attempts to control

trauma while widening the vaginal opening to expedite birth of the infant or provide better access for application of forceps or vacuum cup to the fetus.

Fetal death Delivery of a child who did not at any time after delivery breathe or show any

other evidence of life, such as a heartbeat. Excludes infants that weigh less than 400 grams or that are of a gestational age of less than 20 weeks.

live births registered and fetal deaths combined).

General practice The organisational structure with one or more GPs and other staff such as

practice nurses. A general practice provides and supervises healthcare for a 'population' of patients and can include services for specific populations, such as women's health or Aboriginal and Torres Strait Islander people's

health.

ICD-10-AM The Australian modification of the International Standard Classification of

Diseases and Related Health Conditions. This is the current classification of

diagnoses in Australia.

Hospital boarder A person who is receiving food and/or accommodation but for whom the

hospital does not accept responsibility for treatment and/or care.

Inpatient fraction The ratio of admitted patient costs to total hospital costs, also known as the

admitted patient cost proportion.

Labour cost per casemix-adjusted separation

Salary and wages plus visiting medical officer payments, multiplied by the inpatient fraction, divided by the number of casemix-adjusted separations.

Length of stayThe period from admission to separation less any days spent away from the

hospital (leave days).

Live birth Birth of a child who, after delivery, breathes or shows any other evidence of

life, such as a heartbeat. Includes all registered live births regardless of

birthweight.

Medicare Australian Government funding of private medical and optometrical services

(under the Medicare Benefits Schedule). Sometimes defined to include other

forms of Australian Government funding such as subsidisation of selected pharmaceuticals (under the Pharmaceutical Benefits Scheme) and public hospital funding (under the Australian Health Care Agreements), which provides public hospital services free of charge to public patients.

Mortality rate

The number of deaths per 100 000 people.

Neonatal death

Death of a live born infant within 28 days of birth. Defined in Australia as the death of an infant that weighs at least 400 grams or that is of a gestational age of at least 20 weeks.

Neonatal death rate

Neonatal deaths divided by the number of live births registered.

Newborn qualification status

A newborn qualification status is assigned to each patient day within a newborn episode of care.

A newborn patient day is qualified if the infant meets at least one of the following criteria:

- is the second or subsequent live born infant of a multiple birth, whose mother is currently an admitted patient,
- is admitted to an intensive care facility in a hospital, being a facility approved by the Commonwealth Minister for the purpose of the provision of special care,
- is admitted to, or remains in hospital without its mother.

A newborn patient day is unqualified if the infant does not meet any of the above criteria.

The day on which a change in qualification status occurs is counted as a day of the new qualification status.

If there is more than one qualification status in a single day, the day is counted as a day of the final qualification status for that day.

Nursing workforce

Registered and enrolled nurses who are employed in nursing, on extended leave or looking for work in nursing.

Medical practitioner workforce

Registered medical practitioners who are employed as medical practitioners, on extended leave or looking for work as a medical practitioner.

Multiparous

A woman who has given birth from at least two pregnancies that each resulted in a live birth or stillbirth.

Non-acute care

Includes maintenance care and newborn care (where the newborn does not require acute care).

Non-admitted occasions of service

Occasion of examination, consultation, treatment or other service provided to a non-admitted patient in a functional unit of a health service establishment. Services can include emergency department visits, outpatient services (such as pathology, radiology and imaging, and allied health services, including speech therapy and family planning) and other services to non-admitted patients. Hospital non-admitted occasions of service are not yet recorded consistently across states and territories, and relative differences in the complexity of services provided are not yet documented.

Non-admitted patient

A patient who has not undergone a formal admission process, but who may receive care through an emergency department, outpatient or other non-admitted service.

Perinatal death

Fetal death or neonatal death of an infant that weighs at least 400 grams or that is of a gestational age of at least 20 weeks.

Perinatal death rate

Perinatal deaths divided by the total number of births (that is, live births registered and fetal deaths combined).

Perineal laceration (third or fourth degree)

A 'third degree' laceration or rupture during birth (or a tear following episiotomy) involves the anal sphincter, rectovaginal septum and sphincter NOS. A 'fourth degree' laceration, rupture or tear also involves the anal mucosa and rectal mucosa (NCCH 2008).

Perineal status

The state of the perineum following a birth.

Primary care

Essential healthcare based on practical, scientifically sound and socially

acceptable methods made universally accessible to individuals and families in the community.

Primipara

A woman who has given birth to a liveborn or stillborn infant for the first time.

Public hospital

A hospital that provides free treatment and accommodation to eligible admitted persons who elect to be treated as public patients. It also provides free services to eligible non-admitted patients and can provide (and charge for) treatment and accommodation services to private patients. Charges to non-admitted patients and admitted patients on discharge can be levied in accordance with the Australian Health Care Agreements (for example, aids and appliances).

Puerperium

The time in the woman's perinatal period between the birth and up to 42 days

after the birth.

Real expenditure

Actual expenditure adjusted for changes in prices.

Relative stay index

The actual number of patient days for acute care separations in selected AR–DRGs divided by the expected number of patient days adjusted for casemix. Includes acute care separations only. Excludes: patients who died or were transferred within 2 days of admission, or separations with length of stay greater than 120 days, AR-DRGs which are for 'rehabilitation', AR-DRGs which are predominantly same day (such as R63Z chemotherapy and L61Z admit for renal dialysis), AR-DRGs which have a length of stay component in the definition, and error AR-DRGs.

Same day patients

A patient whose admission date is the same as the separation date.

Sentinel events

Adverse events that cause serious harm to patients and that have the potential to undermine public confidence in the healthcare system.

Separation

A total hospital stay (from admission to discharge, transfer or death) or a portion of a hospital stay beginning or ending in a change in the type of care for an admitted patient (for example, from acute to rehabilitation). Includes admitted patients who receive same day procedures (for example, renal dialysis).

Separation rate

Hospital separations per 1000 people or 100 000 people.

Selected primiparae

Primiparae with no previous deliveries, aged 25–29 years, singleton, vertex presentation and gestation of 37–41 weeks (inclusive).

Subacute care

Specialised multidisciplinary care in which the primary need for care is optimisation of the patient's functioning and quality of life. A person's functioning may relate to their whole body or a body part, the whole person, or the whole person in a social context, and to impairment of a body function or structure, activity limitation and/or participation restriction.

Subacute care comprises the defined care types of rehabilitation, palliative care, geriatric evaluation and management and psychogeriatric care.

Triage category

The urgency of the patient's need for medical and nursing care:

category 1 — resuscitation (immediate within seconds)

category 2 — emergency (within 10 minutes) category 3 — urgent (within 30 minutes) category 4 — semi-urgent (within 60 minutes) category 5 — non-urgent (within 120 minutes).

Urgency category for elective surgery

Category 1 patients — admission within 30 days is desirable for a condition that has the potential to deteriorate quickly to the point that it can become an emergency.

Category 2 patients — admission within 90 days is desirable for a condition that is causing some pain, dysfunction or disability, but that is not likely to deteriorate quickly or become an emergency.

Category 3 patients — admission at some time in the future is acceptable for a condition causing minimal or no pain, dysfunction or disability, that is unlikely to deteriorate quickly and that does not have the potential to become an emergency.

11.9 List of attachment tables

Attachment tables are identified in references throughout this chapter by a '11A' prefix (for example, table 11A.1). Attachment tables are available from the Review website (www.pc.gov.au/rogs/2016).

11A Public hospitals — attachment

Definitions for the indicators and descriptors in this attachment are in section 11.8 of the chapter. Unsourced information was obtained from the Australian, State and Territory governments.

Data in this Report are examined by the Health Working Group, but have not been formally audited by the Secretariat.

Data reported in the attachment tables are the most accurate available at the time of data collection. Historical data may have been updated since the last edition of RoGS.

This file is available in Adobe PDF format on the Review web page (www.pc.gov.au/rogs/2016).

⁽a) Expenditure data exclude depreciation.

(e) In WA, expenditure on public patients at Joondalup and Peel Health Campuses is included from 2006-07 figures but not in those for previous years.

(f) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.

⁽b) Recurrent expenditure on the purchase of public hospitals services at the State, or area health service-level, from privately owned and/or operated hospitals is excluded.

⁽c) NSW hospital expenditure recorded against special purposes and trust funds is excluded.

⁽d) Queensland pathology services were purchased from a statewide pathology service rather than being provided by hospital employees.

⁽a) Depreciation is included in recurrent expenditure.

- (d) The expenditure numbers for the ACT include substantial expenditures for NSW residents, and so the ACT expenditure is overstated.
- (e) Components may not add to totals due to rounding.

REPORT ON GOVERNMENT SERVICES 2016

⁽b) Non-government expenditure includes expenditure by health insurance funds, individuals, workers' compensation and compulsory third-party motor vehicle insurers as well as other sources.

⁽c) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.

- (a) Expenditure data exclude depreciation and interest payments.
- (b) Recurrent expenditure on the purchase of public hospitals services at the State, or area health service-level, from privately owned and/or operated hospitals is not included.
- (c) Expenditure data are deflated using the hospital/nursing home care price index from the AIHW publication Health Expenditure Australia.
- (d) Queensland pathology services were purchased from a statewide pathology service rather than being provided by hospital employees.
- (e) In WA, recurrent expenditure per person from 2006-07 includes expenditure on public patients at Joondalup and Peel Health Campuses. Expenditure for these patients is not included in previous years.
- (f) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.
- (g) In Tasmania, for 2005-06, data for one hospital are not included.
- (h) The expenditure numbers for the ACT include substantial expenditures for NSW residents, and so the ACT expenditure is overstated.

⁽a) The number of hospitals reported can be affected by administrative and/or reporting arrangements and is not necessarily a measure of the number of physical hospital buildings or campuses.

⁽b) Size is based on the average number of available beds.

⁽c) The comparability of bed numbers can be affected by the casemix of hospitals including the extent to which hospitals provide same day admitted services and other specialised services.

⁽d) A change in definition of average available beds may affect comparison over time.

⁽e) The count of hospitals in Victoria is a count of the campuses that report data separately to the National Hospital Morbidity Database.

⁽f) For Victoria for 2009-10 to 2011-12, the numbers of available beds have been adjusted to correct reporting anomalies and to include Secure Extended Care Unit beds. These beds meet the definition of an available bed but were incorrectly excluded from the submissions of some health services to the NPHED. Comparisons of bed numbers published in previous years are not valid for Victoria.

⁽g) In 2012-13 a large number of SA state-funded aged care beds in country hospitals converted into Commonwealth multi-purpose service places. This has resulted in an apparent decrease in the numbers of available beds between 2011-12 and 2012-13. This has also resulted in hospitals shifting categories, there are more hospitals with 10 or fewer beds in 2012-13.

- (a) Population calculated based on a crude rate. Data need to be viewed in the context of the age and sex structure and morbidity and mortality of the population in each jurisdiction. The age and sex structure of the population in each jurisdiction is provided in the 'Statistical appendix' and mortality rates in the 'Health sector summary'.
- (b) Available beds includes both average available beds for overnight and same day accommodation. Average available overnight beds is the number of beds available to provide overnight accommodation for patients (other than neonatal cots (nonspecial-care) and beds occupied by hospital-in-the-home patients), averaged over the counting period. Average available same day beds is the number of beds, chairs or trolleys available to provide accommodation for same-day patients, averaged over the counting period.
- (c) The comparability of bed numbers can be affected by the casemix of hospitals including the extent to which hospitals provide same day admitted services and other specialised services.
- (d) Analysis by remoteness area is of less relevance to geographically smaller jurisdictions and those jurisdictions with small populations residing in remote areas (such as Victoria) (AIHW 2014a).
- (e) In WA, beds available for public patients at Joondalup and Peel Health Campuses are included from 2006-07 figures but not in those for previous years.
- (f) In 2012-13 a large number of SA state-funded aged care beds in country hospitals converted into Commonwealth multi-purpose service places. This has resulted in an apparent decrease in the numbers of available beds between 2011-12 and 2012-13.

PUBLIC HOSPITALS PAGE **4** of TABLE 11A.6

Table 11A.6 Summary of separations, public hospitals (a)

| | Unit | NSW | Vic (b) | Qld | WA | SA | Tas | ACT (c) | NT | Aust |
|------------------------------|------|-----|---------|-----|-----|-----|-----|---------|----|------|
| Public psychiatric hospitals | no. | 0.7 | 0.1 | 0.1 | 0.4 | 0.8 | 2.0 | | | 0.4 |

- (a) Separations for which the care type was reported as newborn with no qualified days, and records for hospital boarders and posthumous organ procurement have been excluded.
- (b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.
- (c) Data on state of hospitalisation should be interpreted with caution because of cross-border flows of patients. This is particularly the case for the ACT. In 2009–10, about 23 per cent of separations for ACT hospitals were for patients who resided in NSW.
- (d) Figures are directly age-standardised to the June 2001 Australian population.
 - .. Not applicable. Nil or rounded to zero.

- (a) Excludes separations for which the care type was reported as 'newborn with no qualified days' and records for hospital boarders and posthumous organ procurement.
- (b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.
- (c) In WA, separations for public patients at Joondalup and Peel Health Campuses are included from 2006-07 figures but not in those for previous years.
- (d) In SA as of 1 July 2007, all sameday chemotherapy and scopes patients were treated on an outpatient basis. This resulted in a drop in sameday inpatient activity from 2007-08 onwards. In addition to this flexible bronchoscopy patients were treated as outpatients from 1 July 2009.
- (e) Aboriginal and Torres Strait Islander people make up a high proportion of the population in the NT which contributes to the high level of separations in the NT. Aboriginal and Torres Strait Islander people are more likely than other Australians to experience poor health.
- (f) Rates per 1000 people are directly age standardised to the Australian population at June 2001.

⁽a) Separations for which the care type was reported as newborn with no qualified days, and records for hospital boarders and posthumous organ procurement have been excluded.

⁽b) Identification of Aboriginal and Torres Strait Islander patients is not considered to be complete and completeness varies among the jurisdictions.

Table 11A.9 Separations by hospital sector and Indigenous status of patient (a), (b)

|----------|-----|---------|-----|----|----|-----|-----|----|-----------|
| | | | | | | | | | |

⁽c) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

- (d) Total includes data only for NSW, Victoria, Queensland, WA, SA and the NT (public hospitals only), for which the quality of Indigenous identification is considered acceptable for the purposes of analysis. Caution should be used in the interpretation of these data because of jurisdictional differences in data quality. In addition, these jurisdictions are not necessarily representative of the excluded jurisdictions.
 - Nil or rounded to zero. **np** Not published.

- (a) Directly age standardised to the Australian population at 30 June 2001.
- (b) Identification of Aboriginal and Torres Strait Islander patients has varied among jurisdictions and over time. From 2011-12 Indigenous data are of acceptable quality for all states and territories in public hospitals. From 2006-07 data for NSW, Victoria, Queensland, SA, WA and the NT (public only) were of acceptable quality. For 2005-06 NSW, Queensland, SA, WA and the NT (public only) were of acceptable quality. Prior to this Queensland, SA, WA and the NT (public only) were of acceptable quality. Data for these jurisdictions should be interpreted with caution as there are jurisdictional differences in data quality and changes in hospitalisation rates for Indigenous people over time may include a component due to improved identification. Indigenous status should therefore be interpreted cautiously.
- (c) Excludes separations with a care type of Newborn without qualified days, and records for Hospital boarders and Posthumous organ procurement.
- (d) In WA, separations for public patients at Joondalup and Peel Health Campuses are included from 2006-07 public hospitals figures but not in those for previous years.
- (e) Private hospital data are supressed for confidentiality reasons.
- The totals include data only for the states and teritories that had acceptable data quality. Caution should be used in the interpretation of these data because of jurisdictional differences in data quality.
 - np Not published.

- (a) Staff per 1000 people are calculated from ABS population data at 31 December 2013 (table 2A.2). Population data used to derive rates are revised to the final 2011 Census rebased estimates and projections. Population data for All Australians for all years are estimates. See chapter 2 (table 2A.2) for details.
- (b) Where average FTE staff numbers are not available for a financial year, staff numbers on the last day of the financial year are used (for example, 30 June 2009, for 2008-09). Staff contracted to provide products (rather than labour) are not included.
- (c) For NSW, 'other personal care staff' are included in 'diagnostic and allied health' and 'domestic and other staff'.
- (d) For Victoria, FTEs may be slightly understated. 'Other personal care staff' are included in 'domestic and other staff'.
- (e) Queensland pathology services staff employed by the state pathology service are not included.
- (f) Many WA hospitals were unable to provide a split between nurse categories and these have been reported as registered nurses.

Table 11A.11 Average full time equivalent (FTE) staff per 1000 persons, public hospitals (including psychiatric hospitals) (a), (b)

NSW (c) Vic (d) Qld (e) WA (f) SA Tas (g) ACT (h) NT Aust

- (g) In Tasmania in 2006-07 data for two small hospitals are not included. Tasmanian 'other personal care' staff are included in 'domestic and other staff'.
- (h) Caution should be used in comparing data for the ACT with other jurisdictions as the ACT workforce serves many residents of southern NSW in addition to ACT residents, while only ACT residents are captured in the denominator.

⁽a) Excludes records for hospital boarders or posthumous organ procurement.

Source: AIHW (various years), Australian Hospital Statistics, Health Services Series; AIHW (2015), Admitted patient care 2013–14: Australian hospital statistics, Health services series no. 60. Cat. no. HSE 156.

⁽b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

⁽c) Total separations include 'newborn unqualified days only', which are not normally included as admitted patient care.

⁽d) Total separations exclude 'newborn unqualified days only', which are not normally included as admitted patient care.

⁽e) Includes separations for which the care type was Other admitted or was not reported.

⁻ Nil or rounded to zero. **na** Not available.

⁽a) Individual non-admitted patient care services. Excludes group sessions. Reporting arrangements have varied significantly across years and across jurisdictions.

⁽b) To align with National Health Reform, non-admitted patient care in Victoria is now reported as 'service events' and reporting of 'occassions of service' is no longer available.

⁽c) Includes data for the Mersey Community Hospital.

⁽d) Radiology figures for the NT are underestimated and pathology figures relate only to three of the five hospitals.

⁽e) Includes only those states and territories for which data are available.

Table 11A.13 Non-admitted patient occasions of service, by type of non-admitted patient care, public hospitals, 2013-14 (a)

Unit NSW Vic (b) Qld WA SA Tas (c) ACT NT (d) Aust (e)

- (f) Other includes the outpatient services of Gynaecology, Obstetrics, Cardiology, Endocrinology, Oncology, Respiratory, Gastroenterology, Medical, General practice primary care, Paediatric, Plastic surgery, Urology, Orthopaedic surgery, Ophthalmology, Ear, nose and throat, Chemotherapy, Paediatric surgery and Renal medical.
- (g) Justice Health (formerly known as Corrections Health) in New South Wales reported a large number of occasions of service that may not be typical of Pharmacy.
- (h) Justice Health (formerly known as Corrections Health) in New South Wales reported a large number of occasions of service that may not be typical of District nursing.

| Data coverage | | | | | | | | | | |
| Estimated proportion of presentations with episode-level data (f) | % | na | na | na | na | na | na | na | na | na |
| Hospitals reporting emergency department episode-level data | no. | na | na | na | na | na | na | na | na | na |

- (a) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.
- (b) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.
- (c) The proportion of occasions of service for which the waiting time to service delivery was within the time specified in the definition of the triage category. For the triage category Resuscitation, an occasion of service was classified as 'seen on time' if the waiting time to service was reported as less than or equal to 2 minutes.
- (d) Values are derived from all hospitals that reported to the non-admitted patient emergency department care database.
- (e) The proportion of occasions of service for which the emergency department departure status was reported as 'admitted to this hospital'.
- (f) Data coverage is estimated as the number of occasions of service with waiting times data divided by the number of emergency department occasions of service. This can underestimate coverage because some occasions of service are for other than emergency presentations. For some jurisdictions, the number of emergency department occasions of service reported to the Non-admitted Patient Emergency Department Care Database exceeded the number of accident and emergency occasions of service reported to the National Public Hospital Establishments Database. For these jurisdictions the coverage has been estimated as 100 per cent.

Table 11A.15 Patients treated within national benchmarks for emergency department waiting time, by hospital peer group, by State and Territory (a), (b)

NSW Vic Qld WA (c) SA (d) Tas ACT NT Aust Aust (total number)

- (a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.
- (b) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.
- (c) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.
- (d) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.
- (e) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.
- (f) The totals include records for which the triage category was not assigned or not reported.
 - Nil or rounded to zero. np Not published.

⁽a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.

⁽b) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

⁽c) The quality of the identification of Aboriginal and Torres Strait Islander patients in National Non-admitted Patient Emergency Department Care Database has not been assessed. Identification of Aboriginal and Torres Strait Islander patients is not considered to be complete, and completeness may vary among the states and territories.

Table 11A.16 Patients treated within national benchmarks for emergency department waiting time, by Indigenous status, by State and Territory (a), (b), (c)

NSW Vic Qld WA (d) SA (e) Tas ACT NT Aust Aust number)

- (e) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.
- The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did (f) not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.
- (g) The totals include records for which the triage category was not assigned or not reported.

np Not published.

Source: AIHW (unpublished) National Non-admitted Patient Emergency Department Care Database.

⁽d) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.

PUBLIC HOSPITALS PAGE **4** of TABLE 11A.17

Table 11A.17 Patients treated within national benchmarks for emergency department waiting time, by remoteness, by State and Territory (a), (b), (c), (d)

| | | NSW | Vic | Qld | WA (e) | SA (f) | Tas | ACT | NT | Aust | Aust (total number) |
|-----------------------|-----|-------|-----|--------|--------|--------|-----|-----|--------|--------|---------------------|
| Total number (g), (h) | no. | 2 076 | 243 | 14 935 | 10 205 | 1 348 | 274 | 17 | 37 990 | 67 088 | |

- (a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.
- (b) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.
- (c) Area of usual residence was not reported or not mappable to SEIFA categories for approximately 2 per cent of records.
- (d) Remoteness areas are based on the usual residential address of the patient. Not all remoteness areas are represented in each State or Territory. The remoteness area 'Major city' does not exist within Tasmania or the NT, 'Inner regional' does not exist within the NT, 'Outer regional' does not exist in the ACT, 'Remote' does not exist in the ACT and 'Very remote' does not exist in Victoria or the ACT. However, data are reported for the state/territory where the hospital was located. This means, for example, that although there is no 'major city' classification in Tasmania, Tasmanian hospitals may treat some patients whose usual residence is a major city in another jurisdiction.
- (e) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.
- (f) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.
- (g) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.
- (h) The totals include records for which the triage category was not assigned or not reported.
 - Nil or rounded to zero. np Not published.

Table 11A.18 Patients treated within national benchmarks for emergency department waiting time, by State and Territory, by SEIFA IRSD quintiles (a), (b), (c), (d)

unit NSW Vic Qld WA (e) SA (f) Tas ACT NT Aust (total number)

- (a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.
- (b) SEIFA quintiles are based on the SEIFA IRSD, with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. The SEIFA quintiles represent approximately 20 per cent of the national population, but do not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is based on the patient's usual residence, not the location of the hospital.
- (c) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.
- (d) Area of usual residence was not reported or not mappable to SEIFA categories for approximately 2 per cent of records.
- (e) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.
- (f) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.
- (g) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.
- (h) The totals include records for which the triage category was not assigned or not reported.

Table 11A.21 Elective surgery waiting times for patients admitted from waiting lists, by hospital peer group, public hospitals (a)

| | NSW | Vic | Qld (b) | WA | SA | Tas (c) | ACT | NT | Aust |
|-----------------------------|-----|-----|---------|-----|-----|---------|-----|-----|------|
| % waited more than 365 days | 1.6 | 2.4 | 0.5 | 0.7 | 1.1 | 12.9 | 5.3 | 3.9 | 1.8 |

- (a) Public hospitals only. Principal referral hospitals and women's and children's hospitals include major cities hospitals with > 20 000 acute casemix adjusted separations a year, as well as specialised acute women's and children's hospitals with > 10 000 acute casemix adjusted separations a year. Large hospitals include major cities acute hospitals treating > 10 000 acute casemix adjusted separations a year, regional acute hospitals treating > 8000 acute casemix adjusted separations a year and remote hospitals with > 5000 acute casemix adjusted separations a year. Medium hospitals include medium acute hospitals in regional and major city areas treating between 5000 and 10 000 acute casemix adjusted separations a year and medium acute hospitals in regional and major city areas treating between 2000 and 5000 acute casemix adjusted separations per year, plus acute hospitals treating < 2000 acute casemix adjusted separations a year acute hospitals treating < 2000 acute casemix adjusted separations a year plus acute hospitals treating < 2000 acute casemix adjusted separations a year plus acute hospitals treating < 2000 acute casemix adjusted separations a year but with > 2000 separations a year.
- (b) For Queensland, the number of admissions includes admissions that were removed from the waiting list for elective admission before the start of the collection period or separated before the end of the collection period. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.
- (c) Mersey Community Hospital is not included in 'Large hospitals' for 2014-15 data.
- (d) Number of hospitals reporting to the National Elective Surgery Waiting Times Data Collection.
- (e) The number of separations with urgency of admission reported as 'elective' and a surgical procedure for public hospitals reporting to the National Elective Surgery Waiting Times Data Collection as a proportion of the number of separations with urgency of admission of 'elective' and a surgical procedure for all public hospitals.
- (f) Number of admissions for elective surgery reported to the National Elective Surgery Waiting Times Data Collection.
- (g) Includes data for hospitals not included in the specified hospital peer groups.
- (h) Crude rate based on the Australian estimated resident population as at 31 December.
- (i) Principal referral and Women's and Children's hospitals do not describe the same set of hospitals under the different peer group classifications. As there are two different peer group classifications used, this constitutes a break in series between 2013-14 and 2014-15.

na Not available. .. Not applicable. – Nil or rounded to zero. **np** Not published.

- (a) The total number of admissions for Queensland include 644 admissions that were removed from the waiting list for elective admission before 30 June 2005 and separated before 30 June 2006. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods. The total number of admissions for Queensland includes 507 patients who were removed from the waiting list for elective admission before 30 June 2007 and separated before 30 June 2008. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.
- (b) For Tasmania in 2008-09, admissions for Orthopaedic surgery were included under the category General Surgery.
- (c) Includes specialty of surgeon 'not reported'
 - .. Not applicable. Nil or rounded to zero. **np** Not published.

- (b) The quality of the data reported for Indigenous status in the National Elective Surgery Waiting Times Data Collection (NESWTDC) has not been formally assessed; therefore, caution should be exercised when interpreting these data. Data for Tasmania and the ACT should be interpreted with caution until further assessment of Indigenous identification is completed. The Australian totals for Aboriginal and Torres Strait islander Australians and Other Australians do not include data for Tasmania and the ACT for 2010-11 and 2011-12.
- (c) Other Australians includes records for which the Indigenous status was Not reported.
- (d) Total includes all removals for elective surgery procedures, including but not limited to the procedures listed above. **np** Not published. Nil or rounded to zero.

- (a) The data presented for this indicator are sourced from linked records in the National Hospital Morbidity Database and National Elective Surgery Waiting Times Data Collection. The linked records represent about 97 per cent of all records in the National Elective Surgery Waiting Times Data Collection for 2010-11 and 2011-12 and about 96 per cent of all records for 2012-13 and 2013-14.
- (b) Disaggregation by remoteness area is by the patient's usual residence, not the location of hospital. Data are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, the data represent the waiting times for patients living in each remoteness area (regardless of their jurisdiction of residence) in the reporting jurisdiction.
- (c) Data are suppressed where there are fewer than 100 elective surgery admissions in the category.

np Not published. – Nil or rounded to zero.

- (a) The data presented for this indicator are sourced from linked records in the National Hospital Morbidity Database and National Elective Surgery Waiting Times Data Collection. The linked records represent about 97 per cent of all records in the National Elective Surgery Waiting Times Data Collection for 2010-11 and 2011-12 and about 96 per cent of all records for 2012-13 and 2013-14.
- (b) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-Economic Disadvantage (IRSD), with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is by the patient's usual residence, not the location of the hospital. Data are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, the data represent the waiting times for patients in each SEIFA quintile (regardless of their jurisdiction of residence) in the reporting jurisdiction.
- (c) Data are suppressed where there are fewer than 100 elective surgery admissions in the category. **np** Not published.

⁽a) The total number of admissions for Queensland includes 644 admissions that were removed from the waiting list for elective admission before 30 June 2005 and separated before 30 June 2006. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods. The total number of admissions for Queensland includes 507 patients who were removed from the waiting list for elective admission before 30 June 2007 and separated before 30 June 2008. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.

^{..} Not applicable. - Nil or rounded to zero. np Not published.

| Per cent of elective surgery separations | 95.0 | 95.0 | 98.0 | 98.0 | 98.0 | 98.0 | 98.0 | 97.9 | 97.9 | 90.2 |

- (a) Waiting times are counted as the time waited in the most recent urgency category plus any time waited in more urgent categories, for example time in category 2, plus time spent previously in category 1.
- (b) There is no specified or agreed desirable wait for category 3 patients, so the term 'extended wait' is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting longer than the agreed desirable waits of 30 and 90 days respectively.
- (c) Data for 2010-11 and prior years are were sourced from the Queensland Government. Data for 2011-12 and after were sourced from the AIHW. Some differences in data may occur between these periods due to the different data sources.
- (d) For 2014-15, Queensland was not able to provide data for 2 hospitals (that reported about 7000 admissions from elective surgery waiting lists in 2013–14) and 5 months of data for a third hospital (that reported about 3700 admissions in 2013–14).
- (e) Data show patients on the waiting list at 30 June.

⁽a) Waiting times are counted as time waited in the most recent urgency category plus any time waited in more urgent categories, for example time in category 2, plus time spent previously in category 1.

Source: Tasmanian Government (unpublished); AIHW (unpublished) National Elective Surgery Waiting Times Data Collection.

⁽b) There is no specified or agreed desirable wait for category 3 patients, so the term 'extended wait' is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting longer than the agreed desirable waits of 30 and 90 days respectively.

⁽c) Data for 2010-11 and prior years are were sourced from the Tasmanian Government. Data for 2011-12 and after were sourced from the AIHW. Some differences in data may occur between these periods due to the different data sources.

⁽d) Data show patients on the waiting list at 30 June.

- (a) Waiting times are counted as time waited in the most recent urgency category plus any time waited in more urgent categories, for example time in category 2, plus time spent previously in category 1.
- (b) Extended waits include those patients overdue in any category, that is, it is not restricted to patients waiting greater than 365 days. There is no specified or agreed desirable wait for category 3 patients, so the term 'extended wait' is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting longer than the agreed desirable waits of 30 and 90 days respectively.
- (c) Data for 2010-11 and prior years are were sourced from the NT Government. Data for 2011-12 and after were sourced from the AIHW. Some differences in data may occur between these periods due to the different data sources.
- (d) Data show patients on the waiting list at 30 June.
- (e) In previous reports, waiting times coverage data were derived including scopes. Data from 2004-05 exclude these scopes.

| Total (c) | 43 | 49 | 57 | 55 | 37 | 29 | 36 | 23 | 47 |

- (a) Includes presentations for all Types of visit.
- (b) Length of stay is calculated as the length of time between presentation to the emergency department and physical departure.
- (c) The total includes presentations for which the triage category was not reported.
- (d) Data for 2012-13 includes Principal referral and specialist women's and children's hospitals, Large hospitals and hospitals in other peer groups that reported to the National Non-Admitted Patient Emergency Department Care Database. Data for 2013-14 includes Principal referral and Women's and children's hospitals, Public acute group A hospitals, Public acute group B hospitals and hospitals in other peer groups that reported to the National Non-Admitted Patient Emergency Department Care Database.
- (e) Principal referral and Women's and Children's hospitals do not describe the same set of hospitals under the different peer group classifications. As there are two different peer group classifications used, this constitutes a break in series between 2012-13 and 2013-14.

.. Not applicable.

- (a) This indicator is limited to public hospitals.
- (b) Cells have been suppressed to protect confidentiality where the presentation could identify a patient or service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. See the Data Quality Statement for further details.
- (c) Total rates and numbers for Australia do not include WA.
- (d) Other Australians' includes separations for non-Indigenous people and those for whom Indigenous status was not stated.
- (e) Disaggregation by remoteness area is by the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of separations for people living in that remoteness area and hospitalised in the reporting jurisdiction.

Table 11A.48

Selected unplanned hospital readmission rates, by Indigenous status, hospital peer group, remoteness and SEIFA IRSD quintiles, 2013-14 (a), (b), (c)

Rate Number

(f) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-Economic Disadvantage (IRSD), with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is by the patient's usual residence, not the location of the hospital. Hence, rates represent the number of separations for patients in each SEIFA quintile divided by the total number of separations for people living in that SEIFA quintile and hospitalised in the reporting jurisdiction.

⁽a) The SAB patient episodes were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). The comparability of the SAB rates among jurisdictions and over time is limited because of coverage differences and because the count of patient days reflects the amount of admitted patient activity, but does not necessarily reflect the amount of non-admitted patient activity.

⁽b) NSW does not provide patient day data, but rather occupied bed day data for calculation of the denominator. There may be some difference between patient day and occupied bed day data.

⁽c) For 2010-11, Qld data only include patients 14 years of age and over.

⁽d) Australian totals include NSW.

|--------|---------|-----|---------|----|----|-----|-----|----|----------|
|--------|---------|-----|---------|----|----|-----|-----|----|----------|

⁽e) Total may not equal sum of components due to rounding.

Source: AIHW unpublished.

⁽f) Coverage estimates may be preliminary.

⁽g) Coverage is the number of patient days for hospitals included in the SAB surveillance arrangements as a proportion of total patient days for all public hospitals.

⁽a) Public hospitals include public acute and public psychiatric hospitals.

(d) Age standardised rate.

na Not available. np Not applicable.

Source: AIHW (unpublished) National Hospital Morbidity Database.

⁽b) Separations that included ICD-10-AM diagnosis and/or external cause codes that indicated an adverse event was treated and/or occurred during the hospitalisation.

⁽c) Categories do not sum to the totals because multiple diagnoses and external causes can be recorded for each separation and external cause codes and diagnosis codes can be used together to describe an adverse event.

⁽a) No data collected for 2006 and 2010.

- (b) In 2008, 2009, 2011, 2012, 2013 and 2014 total include 'Not Stated' for ASGC Remoteness areas. Numbers of 'Not Stated' are significantly higher in 2008 and 2009 than in later years.
- (c) Nurses are allocated to a region based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postcode of residence is used. Records with no information on all 3 locations are coded to 'not stated'. For 2011, region is based on 2006 version Australian Standard Geographical Classification (ASGC) Remoteness Areas. For 2012, 2013 and 2014, region is based on 2011 version Australian Statistical Geography Standard (ASGS) Remoteness Areas. Previous versions of these data were supplied using a mix of 2001 and 2006 versions of the classification so these data may not match earlier supplies.
- (d) In 2008, 2009, 2011, 2012, 2013 and 2014 data include registered and enrolled nurses in the workforce: those who are employed in nursing, on extended leave and looking for work in nursing.
- (e) 2008 data has been revised due to the correction of an error in processing Victoria data.
 - na Not available. np Not published.

- (a) In 2008, 2009, 2011, 2012, 2013 and 2014 data include registered and enrolled nurses in the workforce: those who are employed in nursing, on extended leave and looking for work in nursing.
- (b) 2011, 2012, 2013 and 2014 data are by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.
- (c) No data collected for 2006 and 2010.
- (d) In 2008 and 2009 Victorian data was affected by large numbers of online survey records not being able to be used for technical reasons. Estimates for Victoria for 2008 and 2009 should be treated with caution due to low response rate (39.9 per cent, 33.3 per cent and 31.6 per cent respectively). Estimates for Victoria for 2005 are derived from responses to the 2006 AIHW Nursing and Midwifery Labour Force Census, weighted to 2005 registration and enrolment benchmark figures. Nurse labour force data for 2008 has been revised due to the correction of an error in processing Victorian data.
- (e) Estimates for Queensland for 2008 and 2009 should be treated with caution due to low response rate (32.9 per cent and 28.2 per cent respectively). Estimates for WA for 2008 and 2009 should be treated with caution due to low response rates (34.4 per cent and 35.4 per cent respectively). Estimates for Tasmania for 2009 should be treated with caution due to a low response rate 33.2 per cent.
- (f) Estimates for the NT for 2008 and 2009 should be treated with caution due to low response rates (34.9 per cent and 32.8 per cent respectively). Data for the NT is affected by the transient nature of the nursing labour force in that jurisdiction. According to the Nursing Board Annual Report, approximately one-third of all nurses do not re-register each year, primarily because they no longer practise in the jurisdiction. There has been some variation across years in the degree to which nurses who are interstate have been removed from the renewal process and hence the survey.

⁽a) 2012 and subsequent years excludes provisional registrants.

- (b) In 2008, 2009, 2011, 2012, 2013 and 2014 total include 'Not Stated' for ASGC Remoteness areas. Numbers of 'Not Stated' are significantly higher in 2008 and 2009 than in later years.
- (c) In 2008 and 2009 data include employed medical practitioners, registered medical practitioners on extended leave and registered medical practitioners looking for work in medicine. In 2011, 2012, 2013 and 2014 data include employed medical practitioners.
- (d) In 2008, 2009, 2011, 2012, 2013 and 2014 Remote and very remote areas include Migratory areas. Estimates for remote and very remote areas should be treated with caution due to the relatively small number of medical practitioners used to produce these estimates.
- (e) Medical practitioners are allocated to a region based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postcode of residence is used. Records with no information on all 3 locations are coded to 'not stated'. In 2009, 2010 and 2011, region is based on 2006 version Australian Standard Geographical Classification (ASGC) Remoteness Areas. In 2012 and 2013, region is based on 2011 version Australian Statistical Geography Standard (ASGS) Remoteness Areas. Previous versions of these data were supplied using a mix of 2001 and 2006 versions of the classification so these data may not match earlier supplies.

⁽a) In 2008 and 2009 data include employed medical practitioners, registered medical practitioners on extended leave and registered medical practitioners looking for work in medicine. In 2011, 2012, 2013 and 2014 data include employed medical practitioners.

⁽b) 2011, 2012, 2013 and 2014 data is by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.

⁽c) 2012 and subsequent years excludes provisional registrants.

Table 11A.56 Medical practitioner workforce, by age group (a), (b), (c)

Unit NSW (d) Vic (e) Qld (f), (g) WA (g), (h) SA Tas (i) ACT NT (j) Aust

- (d) In 2008 and 2009, NSW data are based on responses to the Medical Labour Force Survey weighted to financial registrants holding general, conditional specialist, limited prescribing and referring or non-practising registration.
- (e) In 2008 and 2009, Victoria surveyed only general, specific and provisional registered medical practitioners in the Medical Labour Force Survey but responses are weighted to all registered medical practitioners.
- (f) In 2008 and 2009, Queensland data are based on responses to the Medical Labour Force Survey weighted to all registrants excluding some conditional registration types. The Queensland benchmarks for 2009 were taken from the Queensland medical board annual report which included an age breakdown in 10 year increments whilst the estimates for previous years was done using 5 year increments. Given that the response rates have fallen between 2008 and 2009 and that the response rates for some age groups are particularly small, (notably the response rate for 25-34 year olds was only 7.8 per cent for males and 11.4 per cent for females), Queensland data should be treated with caution, particularly for the younger groups.
- (g) In 2010 no data collected.
- (h) In 2008 and 2009, for WA data, the scope has been consistent, that is, the survey population and the benchmark figures are based on general and conditional registrants. For 2005, survey was administered to both general and conditional registrants but benchmark figures were for general registrants only. For 2008 the benchmark used was the total number of registered practitioners in 2008 using 2007 age by sex proportions. For WA in 2007, 2008 and 2009, the benchmark data includes a significant number of registered medical practitioners that are no longer active in the workforce. This inflates the perception of the medical labour force in WA. It is also unknown how significantly past years have been affected. Care should be taken when interpreting these figures.
- (i) In 2008 and 2009, Tasmania data are based on responses to the annual Medical Labour Force Survey weighted to general registrants, conditionally registered specialists and non-practising practitioners only.
- (j) 2010 data is by state of principal practice, while 2011, 2012 and 2013 data is by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.

REPORT ON GOVERNMENT SERVICES 2016

Table 11A.57 Average cost per admitted acute weighted separation, excluding depreciation, (a), (b), (c), (d), (e), (f), (g), (h)

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT (b) | Aust |
|---------|-------|-------|-------|-------|-------|-------|-------|--------|-------|
| 2012-13 | 4 813 | 4 213 | 4 800 | 5 411 | 5 113 | 5 106 | 6 256 | 5 802 | 4 784 |
| 2013-14 | 4 788 | 4 228 | 4 783 | 5 624 | 5 402 | 4 942 | 6 664 | 6 840 | 4 836 |

- (a) Based on Financial years. Any work-in-progress separations are excluded from this analysis.
- (b) All NHCDC sample hospitals are patient costed sites (there are no cost modelled sites).
- (c) Average cost is calculated based on all inscope cost buckets (including ed_pro buckets for admitted cost)
- (d) Sample size (hospitals) is counted based on the establishment id field in admitted patient care (APC) collection.
- (e) Above results include admitted Emergency department costs.
- (f) Above results are as per the Australian Refined Diagnostic Related Groups (AR-DRG) vs. 7.
- (g) All results above are actual (not estimated) costs.
- (h) Cost in NHCDC is linked with activity to have a fully linked cost and activity dataset.

⁽a) Capital cost is defined as the user cost of capital (calculated at 8 per cent of the current value of non-current physical assets) plus the depreciation amount.

⁽b) Variation across jurisdictions in the collection of capital related data suggests the data are only indicative.

⁽c) The asset values and depreciation amounts for Victoria and WA relate to inpatients only.

| Public patients (c) | 1.02 | 0.92 | 0.85 | 0.96 | 1.03 | 0.97 | 1.07 | 1.14 | 0.96 |
| Funding source | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust |

- (a) Separations exclude newborns with unqualified days, organ procurement posthumous and hospital boarders.
- (b) The relative stay index is based on all hospitals and is estimated using the indirect standardisation method and AR-DRG version 6.0x. The indirectly standardised relative stay index is not strictly comparable across jurisdictions but is a comparison of the jurisdiction with the national average based on the casemix of the jurisdiction.
- (c) Includes separations with a funding source of Health service budget, Other hospital or public authority (with a Public patient election status), Health service budget (due to eligibility for Reciprocal health care agreements) and Health service budget—no charge raised due to hospital decision (in public hospitals).
- (d) Includes separations with a funding source of Other compensation, Department of Defence, Correctional facilities, Other hospital or public authority (without a Public patient election status), Other, Health service budget—no charge raised due to hospital decision (in private hospitals) and not reported.

Source: AlHW (2015), Admitted patient care 2013–14: Australian hospital statistics, Health services series no. 60. Cat. no. HSE 156.

⁽a) All hospitals submitted are patient costed sites.

⁽b) 2013-14 is based on 243 public sector hospitals.

⁽c) Estimated data is not available.

Table 11A.66 Average cost for emergency department presentations, 2013-14 (a), (b), (c), (d), (e), (f), (g), (h)

Line item NSW Vic Qld WA SA Tas ACT NT Aust

- (d) Above results are based on URG version 1.3.
- (e) The data presented excludes 256 263 ED presentations. 101 614 were submitted as part of the NHCDC and but were WIP episodes or did not link to the activity dataset. 154 649 are virtual presentations identified as components of admitted epsiodes. These presentations were in Western Australia and the cost associated with them is \$102 906 380.17.
- (f) Above information is from the Round 18 Cost weight ED National Table. Round 18 is the first Round in which WIP patients have been excluded from the ED cost weight tables. The number of WIP presentations accounted for only 0.02 per cent of total presentations.
- (g) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.
- (h) The total row is the in-scope average cost by jurisdiction. It does not equate to the sum of the line items as out of scope costs have been excluded.
- Nil or rounded to zero. VMO=Visiting Medical Officer.

- (a) Costs include depreciation.
- (b) This table includes only URG level information (version 1.3) submitted by jurisdictions for three Rounds 16 (2011-12), 17 (2012-13) and 18 (2013-14).
- (c) All hospitals submitted are patient costed sites.
- (d) Estimated data is not available.
- (e) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.
- (f) 2013-14 is based on 243 public sector hospitals.
- (g) The data presented excludes 256 263 ED presentations. 101 614 were submitted as part of the NHCDC and but were WIP episodes or did not link to the activity dataset. 154 649 are virtual presentations identified as components of admitted epsiodes. These presentations were in WA and the cost associated with them is \$102 906 380.17.

Table 11A.68 Non-admitted service events and average cost per service events by Tier 2 Clinic (a), (b), (c), (d), (e), (f), (g)

| | Service events | Average cost |
|---------|----------------|--------------|
| | no. | \$ |
| 2011-12 | 10 679 807 | 313 |
| 2012-13 | 12 603 383 | 316 |
| 2013-14 | 15 942 351 | 282 |

- (a) Cost weights for Round 18 in the non-admitted Tier 2 class stream will not be published.
- (b) 2013-14 represent 349 hospitals.
- (c) Round 16 includes only Tier 2 class version 1.2. Round 17 includes both version 1.2 and 2. Round 18 includes only version 2.
- (d) All hospitals are patient costed sites.
- (e) For NHCDC Round 16 (2011-12), all jurisdictions, except NSW and SA, submitted non-admitted data; for NHCDC Round 17 (2012-13), SA did not submit non-admitted data but NSW submitted non-admitted data for the first time; Round 18 (2013-14) all jurisdictions except SA submitted non-admitted data.
- (f) Estimation for non-admitted is not available.
- (g) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.

⁽a) For multiple births, the method of birth of the first born baby was used.

Source: AIHW (unpublished), National Perinatal Data Collection.

⁽b) Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.

⁽c) In 2010 and 2011, for NSW and WA, 'Non-instrumental vaginal' includes all women who had a vaginal breech birth, whether or not instruments were used. For the remaining jurisdictions, vaginal breech births are only included where instruments were not used. In 2009 for NSW, Victoria, WA and the NT, 'Non-instrumental vaginal' includes all women who had a vaginal breech birth, whether or not instruments were used. For the remaining jurisdictions, vaginal breech births are only included where instruments were not used.

⁽d) Between 12 and 15 per cent of births each year in the ACT are to non-residents of the ACT.

⁽e) Instrumental vaginal birth includes forceps and vacuum extraction.

⁻ Nil or rounded to zero.

PUBLIC HOSPITALS PAGE **8** of TABLE 11A.101

Table 11A.101 Perineal status after vaginal births (a), (b), (c)

| | Unit | NSW | Vic (d) | Qld | WA | SA | Tas (e) | ACT (f) | NT | Aust |
|------------|------|-------|---------|-------|-------|-------|---------|---------|-------|-------|
| Not stated | % | _ | 0.4 | _ | _ | _ | - | _ | _ | _ |
| Total | % | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |

- (a) 1st degree laceration: perineal laceration, rupture or tear during delivery involving fourchette, labia, skin, slight, vagina, vulva; 2nd degree laceration: perineal laceration, rupture or tear during delivery as with 1st degree also involving pelvic floor, perineal muscles, vaginal muscles; 3rd degree laceration: perineal laceration, rupture or tear during delivery as with 2nd degree also involving anal sphincter, rectovaginal septum, sphincter NOS; 4th degree laceration: perineal laceration, rupture or tear during delivery as with 3rd degree also involving anal mucosa, rectal mucosa. Because of differences in definitions and methods used for data collection, care must be taken when comparing across jurisdictions.
- (b) For multiple births, the perineal status after delivery of the first born was used.
- (c) Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.
- (d) Include mothers reported with a labial, clitorial, vaginal and/or cervical laceration.
- In 2010 and 2011, for Tasmania, cases where both a laceration and episiotomy occurred were coded as 'Combined laceration and episiotomy' in the electronic systems. In the paper-based form they were recorded as 'Episiotomy'. Care must be taken when interpreting these numbers. Before 2010, for Tasmania, cases where both a laceration and episiotomy occured were coded as episiotomy. Care must be taken when interpreting these numbers.
- (f) Between 12 and 15 per cent of births each year in the ACT are to non-residents of the ACT.
- (g) For NSW, includes unspecified perineal tear and vulval or perineal haematoma.
- (h) In 2010 and 2011, for Queensland, other includes genital grazes such as clitoral or labial.
- (i) In 2010 and 2011, for WA, 'other' includes unspecified perineal tear and vulval or perineal haematoma.
 - Nil or rounded to zero. **np** Not published. **na** Not published.

⁽a) Cells with fewer than five separations have been marked 'np' for privacy concerns.

Table 11A.102 Separations, patient days, ALOS and cost per separation for selected maternity AR-DRG (version 6.0x) in selected public hospitals (a), (b)

Unit NSW Vic Qld WA SA Tas (c), (d) ACT (c) NT (c),(e) Aust

- (b) Estimated population costs are obtained by weighting the sample results according to the known charactistics of the population.
- (c) DRGs with few separations depict an average cost per patients that is significantly different to that reported nationally. Results for smaller jurisdictions such as Tasmania, NT and the ACT are affected by diseconomies of scale and the requirement to provide comprehensive health care to their populations. Caution should be used when interpreting this information. Due to the relatively few observations within these DRGs, smaller State/Territories (Tasmania, NT and ACT) average cost per patient is not a suitable measure if intended for comparative purposes.
- (d) The effects of the interaction and relation betwee Public and Private sectors in the provision of Tasmanian health service should be considered when interpreting the data. An example of this is the Public Sector is the only provider of Intensive Care Services to the North and North West of the State.
- (e) The admitted patient results from the NT will be affected by many factors distinguishing them from the average for the nation. Including, issues of remoteness, poor health status of the population, measurable high instance of chronic disease not reflected in DRG assignment, low numbers of primary care facilities and lack of community based opportunities to aid in discharge planning strategies. NT ALOS is consistently greater or equal to the national average. The reasons for this will vary from DRG to DRG, but typically it is a function of large distances travelled by the patient and there may be language issues and additional supervision prior top surgery (many Indigenous Australians do not speak English as a first language), interruption of the process due to emergency procedures, (only having a single hospital in each location), and few opportunities for those individuals suffering from chronic poverty, and a lack or responsiveness of the DRGs to the high levels of chronic illness many of the Indigenous patients suffer.
- (f) The sample size is the number of hospitals contributing to the cost and activity data for each AR-DRG.
- (g) Average cost is affected by a number of factors, some of which are admission practices, sample size, remoteness and the type of hospitals contributing to the collection. Direct comparison between jurisdictions is difficult as there are differences in hospital costing systems. In accordance with NHCDC methodology, depreciation and some capital costs are included in these figures, except for Victoria, which did not include depreciation cost in 2009-10 but did in 2010-11 (Round 15).
- (h) Instead of O03Z, O04Z (which are DRGs in ARDRG version 5.2), figures are according to DRGs (O03A, O03B, O04A, O04B) in AR-DRG version 6.0x).
 - ALOS = patient's Average Length of Stay. c = catastrophic. cc = complications and co-morbidities. Or Pr = operating room procedure. s = severe. w/o = without. w = with.
 - .. Not applicable. Nil or rounded to zero.

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Affected data in this table is 2010 (preliminary). See ABS Causes of Death (cat. no. 3303.0) 2010 Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.
- (b) Annual rates fluctuate (in particular, for smaller jurisdictions) as a result of a low incidence of fetal deaths and small populations.
- (c) Some fetal deaths occurring in WA could be the result of termination of pregnancy at 20 weeks gestation or more.
- (d) Data may exclude stillbirth data which were not received or processed by the ABS in time for the finalisation of the 2008 reference year. According to scope rules, these 2008 data will be included in the 2010 reference year.
- (e) All states and territories, including other territories.
- (f) All births is the number of live births and fetal deaths combined. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.
- (9) Perinatal deaths (including fetal deaths) for years 2003-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.

REPORT ON GOVERNMENT SERVICES 2016

⁽h) Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.

⁽a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table is 2010 (preliminary). See ABS Causes of Death (cat. no. 3303.0) 2010 Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.

- (b) Annual rates fluctuate (in particular, for smaller jurisdictions) as a result of a low incidence of neonatal deaths and small populations.
- (c) All states and territories, including other territories.
- (d) Total live births are all live births registered in the calendar year.
- (e) Perinatal deaths (including neonatal deaths) for years 2003-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.
- (f) A neonatal death is the death within 28 days of birth of a child who after delivery, breathes or shows any evidence of life such as a heartbeat.

Source: ABS Perinatal deaths, Australia, Cat. no. 3304.0, Canberra (unpublished).

Table 11A.107 Neonatal, fetal and perinatal death rates, Australia (a)

| | Fetal death rate (b) | Neonatal death rate (c) | Perinatal death rate (d) |
|------|----------------------|-------------------------|--------------------------|
| 2004 | 6.7 | 3.2 | 9.9 |
| 2005 | 6.9 | 3.5 | 10.4 |
| 2006 | 5.9 | 3.2 | 9.0 |
| 2007 | 5.7 | 2.9 | 8.6 |
| 2008 | 5.4 | 2.8 | 8.2 |
| 2009 | 5.9 | 3.0 | 8.8 |
| 2010 | 5.8 | 2.8 | 8.6 |
| 2011 | 5.8 | 2.7 | 8.4 |
| 2012 | 5.9 | 2.3 | 8.2 |
| 2013 | 5.7 | 2.5 | 8.2 |

- (a) Perinatal deaths (including fetal and neonatal deaths) for years 2003-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.
- (b) Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.
- (c) A neonatal death is the death within 28 days of birth of a child who after delivery, breathes or shows any evidence of life such as a heartbeat.
- (d) Perinatal deaths are fetal and neonatal deaths combined. Fetal deaths exclude those records where gestational age was less than 20 weeks or birthweight was known to be less than 400 grams.

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Affected data in this table is 2010 (preliminary). See ABS Causes of Death (cat. no. 3303.0) 2010 Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.
- (b) Annual rates fluctuate (in particular, for smaller jurisdictions) as a result of a low incidence of perinatal deaths.
- (c) Data may exclude stillbirth data which were not received or processed by the ABS in time for the finalisation of the 2008 reference year. According to scope rules, these 2008 data will be included in the 2010 reference year.
- (d) All states and territories, including other territories.
- (e) Total all births is the number live births and fetal deaths combined. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.
- (f) Perinatal deaths for years 2003-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.
- (g) Perinatal deaths are fetal and neonatal deaths combined. Fetal deaths exclude those records where gestational age was less than 20 weeks or birthweight was known to be less than 400 grams.

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006 (final) 2007 (final), 2008 (final), 2009 (revised), 2010 (preliminary). See Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.
- (b) Perinatal deaths (including fetal and neonatal deaths) for years 1999-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.
- (c) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These 5 states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths.
- (d) Total includes data for NSW, Queensland, WA, SA and the NT only.
- (e) Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.
- (f) Total all births is the number of live births and fetal deaths combined. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.
- (g) Other Australians includes Indigenous status not stated.
- (h) A neonatal death is the death within 28 days of birth of a child who after delivery, breathes or shows any evidence of life such as a heartbeat.
- (i) Total live births are all live births registered in the calendar year.
- (j) Perinatal deaths are fetal and neonatal deaths combined. Fetal deaths exclude those records where gestational age was less than 20 weeks or birthweight was known to be less than 400 grams.

Data quality information — Public hospitals, chapter 11

Data quality information

Data quality information (DQI) provides information against the seven Australian Bureau of Statistics (ABS) data quality framework dimensions, for a selection of performance indicators and/or measures in the Public hospitals chapter. DQI for additional indicators will be progressively introduced in future reports.

Technical DQI has been supplied or agreed by relevant data providers. Additional Steering Committee commentary does not necessarily reflect the views of data providers.

DQI are available for the following performance indicators:

| Data quality information — Public nospitals, chapter 11 | 1 |
|---|----|
| Emergency department waiting times | 1 |
| Waiting times for admitted patient services | 8 |
| Separation rates for selected procedures | 20 |
| Selected unplanned hospital readmission rates | 23 |
| Adverse events in public hospitals | 27 |
| Workforce sustainability | 36 |
| Relative stay index | 40 |
| Recurrent cost per non-admitted occasion of service | 42 |
| Patient satisfaction | 44 |
| Caesareans and inductions for selected primiparae | 47 |
| Instrument vaginal births | 48 |
| Vaginal birth after caesarean section | 50 |
| Perineal status after vaginal birth | 51 |
| Mother's average length of stay | 53 |
| Apgar score at five minutes | 55 |
| Fetal, neonatal and perinatal deaths | 57 |

Emergency department waiting times

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Emergency department waiting times by triage category

Indicator definition and description

Element

Effectiveness — access

Indicator

Emergency department waiting times — Emergency department waiting times by triage category

Triage category 1: seen within seconds, calculated as less than or equal to 2

Measure (computation

The national benchmark waiting times are:

- minutes
- Triage category 2: seen within 10 minutes
- Triage category 3: seen within 30 minutes
- Triage category 4: seen within 60 minutes
- Triage category 5: seen within 120 minutes

The proportion of patients seen on time is calculated as:

Numerator—Number of patients seen within the cut-off point, by triage category.

Denominator—Number of patients by triage category.

Inclusions: records with a type of visit of Emergency presentation.

Exclusions: records with an episode end status of *Did not wait to be attended by a health care professional* or *Dead on arrival, not treated in emergency department.* Records are also excluded if the waiting time was missing or otherwise invalid.

Data source/s

This indicator is calculated using data from the AlHW's NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC).

For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area level 2 (SA2) as at 30 June 2013 (2013–14) or 30 June 2014 (2014–15). Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

<u>For data by remoteness</u>: ABS ERP as at 30 June 2013 (2013–14) or 30 June 2014 (2014–15), by remoteness areas, as specified in the Australian Statistical Geography Standard.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth)*, ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care (including waiting times for care) for non-admitted patients registered for care in emergency departments in public hospitals. For the years to 2012–13 inclusive, the scope of the NNAPEDCD was public hospitals classified as either *Principal referral and Specialist women's and children's hospitals* (peer group A) or *Large hospitals* (peer group B).

From 2013–14, the scope of the NNAPEDCD was patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas
- ability to provide resuscitation, stabilisation and initial management of all emergencies
- availability of medical staff in the hospital 24 hours a day
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

In 2013–14 and 2014–15, hospitals in NNAPEDCD provided about 88 per cent of all public hospital emergency presentations.

The data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

For prior reporting periods, the indicator included only peer group A (*Principal referral and Specialist women's and children's hospitals*), peer group B (*Large hospitals*) and the Mersey Community Hospital. For this reporting period, the scope of the indicator has been increased to all public hospitals reporting to the NAPEDC NMDS. Data for 2013–14 have been resupplied for the revised scope. It is not possible to provide comparable data for the years prior to 2013–14, thus data for 2012–13 and previous years for this indicator are not directly comparable with data for 2013–14 and subsequent years.

The analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 (SA2) of usual residence of the patient. However, data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence. Hence, data represent the proportion of patients living in each remoteness area or Socio-Economic Indexes for Areas (SEIFA) population group (regardless of their jurisdiction of residence) seen within the benchmark time in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction. The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). For 2013–14 and 2014–15, the SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness Accuracy

The reference period for these data is 2013–14 and 2014–15.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors (including waiting time outliers) are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

The quality of Indigenous status data in the NNAPEDCD has not been formally

assessed for completeness; therefore caution should be exercised when interpreting these data.

As this indicator is limited to public hospitals classified in peer groups A and B, most of the data relates to hospitals within major cities. Consequently, the data may not cover areas where the proportion of Indigenous Australians (compared with other Australians) is higher than average. Similarly, disaggregation by socioeconomic status and remoteness should be interpreted with caution.

Comparability across jurisdictions may be impacted by variation in the assignment of triage categories.

Coherence

The data reported for 2013–14 and 2014–15 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals. However, as discussed in the Relevance section above, the scope of the indicator has been increased to all public hospitals reporting to the NAPEDC NMDS. Data for 2013–14 have been resupplied for the revised scope. It is not possible to provide comparable data for the years prior to 2013–14. Any comparison of data over time should take into account changes in scope, coverage and administrative and reporting arrangements.

Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.

The information presented for this indicator are calculated using the same methodology as data published in *Emergency department care: Australian hospital statistics* (report series.

However, 2013–14 data reported previously in these publications by hospital peer group are different from the equivalent data published here because of changes in the peer group classification.

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See

http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification.

Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 are not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012–13 and 2013–14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011-12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011–12 are reported using SEIFA 2011 at the SLA level. Data for 2012-13 and 2013-14 are reported using SEIFA 2011 at the Statistical Area level 2 (SA2). The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable

with SEIFA data for 2012-13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: *Australian hospital statistics* suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the Non-Admitted Patient Emergency Department Care (NAPEDC) National Minimum Data Set (NMDS) is published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.

The National health data dictionary can be accessed online at: http://meteor.aihw.gov.au/content/index.phtml/itemld/268110

The Data Quality Statement for the 2013–14 NNAPEDCD can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemld/592264

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The comparability of emergency department waiting times data across jurisdictions can be influenced by differences in data coverage and clinical practices in particular, the allocation of cases to urgency categories. The proportion of patients in each triage category who were subsequently admitted can indicate the comparability of triage categorisations across jurisdictions and thus the comparability of the waiting times data.
- The scope of the data used to produce this indicator is non-admitted patients
 registered for care in emergency departments in public hospitals reporting to the
 Non-admitted patient emergency department care (NAPEDC) National Minimum
 Data Set (NMDS). It does not include emergency presentations to hospitals that
 have emergency departments that do not meet the criteria specified in the
 NAPEDC NMDS. Therefore, disaggregation by remoteness, socioeconomic status
 and Indigenous status should be interpreted with caution.
- For 2013–14 and 2014–15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.
- The quality of Indigenous status data in the NNAPEDCD has not been formally assessed for completeness; therefore caution should be exercised when interpreting these data.
- In previous reports, the scope of the data used to produce this indicator was non-admitted patients registered for care in emergency departments in public hospitals classified as either peer group A (*Principal referral and Specialist women's and children's hospitals*) or peer group B (*Large hospitals*). The scope of data provided for this indicator has changed, therefore data provided in this report are not comparable to data calculated in previous reporting periods.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Proportion of emergency department presentations with length of stay of 4 hours or less

Indicator definition and description

Element Effectiveness — access

Indicator Emergency department waiting times — Proportion of emergency department

presentations with length of stay of 4 hours or les

Measure (computation Calculation includes presentations with any type of visit to emergency department. ED stay length is calculated by subtracting presentation time/date from physical departure time/date, which is recorded as per the business rules included in the

NAPEDC NMDS 2014-15:

http://meteor.aihw.gov.au/content/index.phtml/itemId/566909

The percentage of presentations to public hospital emergency departments completed within four hours is calculated as:

Numerator—Number of ED presentations where ED stay is less than or equal to four hours.

Denominator—Number of ED presentations.

Calculation includes all presentations where an ED stay completed in the reporting period, including records where the presentation date/time is prior to the reporting period. Invalid records are excluded from the numerator and denominator. Invalid records are records for which:

- Length of stay < 0.
- Presentation date or time missing.
- Physical departure date or time missing.

Data source/s

This indicator is calculated using data from the Australian Institute of Health and Welfare's (AIHW's) NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC).

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care for non-admitted patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

 purposely designed and equipped area with designated assessment, treatment and resuscitation areas

- ability to provide resuscitation, stabilisation and initial management of all emergencies
- availability of medical staff in the hospital 24 hours a day
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

The data presented here are not necessarily representative of hospitals not included in the NNAPEDCD. Hospitals not included do not have emergency departments in scope for reporting to the NAPEDC NMDS.

Data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

The financial year of 2011–12 is the first reporting period that these data are available according the agreed specification.

Accuracy

For 2013–14 and 2014–15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Coherence

The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 and subsequent years with data reported for previous years.

For 2012–13, the scope of the Non-admitted patient emergency department care national minimum data set was non-admitted patients registered for care in emergency departments in selected public hospitals that are classified as either Peer Group A or B in the Australian Institute of Health and Welfare's Australian Hospital Statistics publication from the preceding financial year.

For 2013–14, the scope of the Non-admitted patient emergency department care national minimum data set specification (NAPEDC NMDS) is patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas.
- ability to provide resuscitation, stabilisation and initial management of all emergencies.
- availability of medical staff in the hospital 24 hours a day.
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

The data reported for 2014–15 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals.

In addition, the data reported to the NNAPEDCD in previous years has been consistent with the numbers of emergency occasions of services reported to the NPHED for each hospital for the same reference year.

Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.

The information presented for this indicator are calculated using the same methodology as data published in Emergency department care: Australian hospital statistics (report series).

Accessibility

The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: Australian hospital statistics suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the NAPEDC NMDS and the NAPEDC Data Set Specification (DSS) are published in the AIHW's online metadata repository,

METeOR, and the National health data dictionary.

National health data dictionary can be accessed online http://meteor.aihw.gov.au/content/index.phtml/itemId/268110

The Data Quality Statement for the 2013-14 NNAPEDCD can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemld/592264

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The scope of the data used to produce this indicator is non-admitted patients registered for care in emergency departments in public hospitals reporting to the Non-admitted Patient Emergency Department Care (NAPEDC) National Minimum Data Set (NMDS). It does not include emergency presentations to hospitals that have emergency departments that do not meet the criteria specified in the NAPEDC NMDS. Therefore, disaggregation by remoteness, socioeconomic status and Indigenous status should be interpreted with caution.
- The scope of the NAPEDC NMDS changed between the 2012-13 and 2013-14 reporting periods. These changes may affect comparability of the data reported for 2013–14 and subsequent years with data reported for previous years.
- For 2013-14 and 2014-15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.
- Caution should be used in comparing these data with earlier years as the number of reporting hospitals and the peer group for a hospital may vary over time.

Waiting times for admitted patient services

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Overall elective surgery waiting times

Indicator definition and description

Element Effectiveness — access

Indicator

Waiting times for admitted patient services — Overall elective surgery waiting times The number of days' waiting time is calculated by subtracting the listing date for care Measure from the removal date, minus any days when the patient was not ready for care and (computation

minus any days the patient was waiting with a less urgent clinical urgency category

than their clinical urgency category at removal.

The 50th percentile (median) represents the number of days within which 50 per cent of patients were admitted; half the waiting times will be shorter than the median and half the waiting times longer. The 90th percentile data represent the number of days

within which 90 per cent of patients were admitted.

Data source/s For 2013–14, this indicator is calculated using data from the Elective surgery waiting

times cluster of the NHMD, based on the National Minimum Data Set (NMDS) for

Admitted patient care (also in the Elective surgery waiting times NMDSs).

For 2011-12 and 2012-13, the NESWTDC was linked to the NHMD, based on the NMDS for Admitted patient care, to allow disaggregation by remoteness of area of usual residence and SEIFA of usual residence (all jurisdictions).

For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area 2 (SA2) as at 30 June 2013 (2013-14). Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

For data by remoteness: ABS ERP as at 30 June 2013 (2013-14), by remoteness

areas, as specified in the Australian Statistical Geography Standard.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth)*, ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Elective surgery waiting times (removals data) is to collect information about patients waiting for elective surgery in public hospitals. The scope of this NMDS is patients removed from waiting lists for elective surgery (as either an elective or emergency case) which are managed by public acute hospitals. This includes private patients treated in public hospitals and may include public patients treated in private hospitals.

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

Analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 of usual residence of the patient.

The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, data represent the waiting time for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of

residence) for the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness Accuracy

The reference period for these data is 2011–12, 2012–13 and 2013–14 and 2014–15. For 2013–14:

- Coverage of the NESWTDC was 93 per cent nationally, and 97 per cent or more in all states and territories except Victoria, where it was 77 per cent.
- Almost all public hospitals provided data for the NHMD in 2013–14, with the
 exception of all separations for a mothercraft hospital in the Australian Capital
 Territory. Approximately 96 per cent of NESWTDC records for removals for elective
 surgery were also provided in the Elective surgery waiting times cluster in the
 NHMD.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, and for individual surgical specialties and indicator procedures, as well as overall. Interpretation of waiting times for jurisdictions should take into consideration these differences.
- The Indigenous status data were sourced from the NHMD in 2013–14 for all jurisdictions.
- For 2009–10, the data for Albury Base Hospital (previously reported in New South Wales hospital statistics) was reported by the Victorian Department of Health as part of the Albury Wodonga Health Service. From 2010–11, the data for Albury Base Hospital have not been available.
- From 2011–12, South Australia and Western Australia provided data for a large number of smaller hospitals (32 and 22 respectively) that were not included in the data for previous years.
- For 2014–15, Queensland was not able to provide data for 2 hospitals (that reported about 7,000 admissions from elective surgery waiting lists in 2013–14) and 5 months of data for a third hospital (that reported about 3,700 admissions in 2013–14). In 2011–12, Queensland was not able to provide data for the same 3 hospitals and these hospitals reported data for only 3 of the 4 quarterly periods in 2012–13.
- The increase in admissions for the Northern Territory between 2010–11 and 2011–12 was, in part, due to the inclusion of certain surgical procedures from 2011–12 that had previously been incorrectly excluded from the NESWTDC by the Northern Territory.

Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual datasets are checked against data from other datasets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Cells based on fewer than 100 elective surgery admissions were suppressed.
- Cells based on data from one public hospital only were suppressed.

Coherence

Caution should be exercised when comparing waiting times data between jurisdictions due to differences in the assignment of clinical urgency categories (see *Australian hospital statistics 2013–14: elective surgery waiting times*, Appendix A http://www.aihw.gov.au/publication-detail/?id=60129549064).

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See

http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AlHW peer group classification. Peer group data for this reported has been calculated using the current AlHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AlHW peer group classification. Data based on the current AlHW peer group classification

has been backcast to 2011-12 for this report.

The data can be meaningfully compared across reference periods, except for the Indigenous disaggregation. Caution should be used in comparing data using the previous peer group classification across reference years, as the number of hospitals classified as peer group A or B, or the peer group of a hospital, may vary over time. Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

The information presented for this indicator is based on the same data as published in, *Australian hospital statistics 2013–14, Australian hospital statistics: elective surgery waiting times* (report series.

The data reported for the 2013–14 and 2014–15 NEWSTDC are consistent with data reported for previous years for individual hospitals.

In addition, some 2013–14 data reported previously in these publications are different from the equivalent data published here depending upon the peer group classification used.

Caution should be exercised when interpreting the 2014–15 data as potential revisions to the 2014–15 NESWTDC data could occur following jurisdictional provision of elective surgery waiting times cluster data.

Analyses presented in *Australian hospital statistics* and previous *National Healthcare Agreement performance* reports may also differ slightly depending on whether the NESWTDC or linked NESWTDC/NHMD was used.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2011-12 reported by remoteness are reported for RA 2006. Data for 2012-13 and 2013-14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years. When comparing data over time, analyses based on data that has been linked to the NHMD should not be compared with analyses based on data sourced from the NESWTDC. In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level and data for 2012-13 are reported using SEIFA 2011 at the SA2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012-13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NESWTDC. Published products available on the AIHW website are the *Australian hospital statistics* suite of products with associated Excel tables.

These products may be accessed on the AIHW website http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the Elective Surgery Waiting Times (ESWT) NMDS and the Admitted patient care NMDS is published in the AlHW's online metadata repository,

METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/268110

The Data Quality Statement for the 2013–14 NESWTDC can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592510

The Data Quality Statement for the 2013–14 NHMD can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/611030

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Analyses for remoteness and socioeconomic status are based on the reported area
 of usual residence of the patient, regardless of the jurisdiction of the hospital. This
 is relevant if significant numbers of one jurisdiction's residents are treated in
 another jurisdiction.
- Interpretation of waiting times for jurisdictions should take into consideration crossborder flows, particularly for the Australian Capital Territory.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.
- The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not directly comparable with data reported using the current AIHW peer group classification.

Elective surgery waiting times by clinical urgency category

Indicator definition and description

Element Effectiveness — access

Indicator Waiting times for admitted patient services — Elective surgery waiting times by clinical

urgency category

Measure (computation Elective surgery waiting times by clinical urgency category reports the proportion of patients who were admitted from waiting lists after an extended wait. The three generally accepted clinical urgency categories for elective surgery are:

- category 1 admission is desirable within 30 days for a condition that has the
 potential to deteriorate quickly to the point that it may become an emergency.
- category 2 admission is desirable within 90 days for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency.
- category 3 admission at some time in the future acceptable for a condition causing minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and which does not have the potential to become an emergency. Desirable timeframe for this category is admission within 365 days.

Data source/s

For 2013–14, this indicator is calculated using data from the Elective surgery waiting times cluster of the NHMD, based on the National Minimum Data Set (NMDS) for Admitted patient care (also in the Elective surgery waiting times NMDSs).

For 2011–12 and 2012–13, the NESWTDC was linked to the NHMD, based on the NMDS for Admitted patient care, to allow disaggregation by remoteness of area of usual residence and SEIFA of usual residence (all jurisdictions).

Data Quality Framework Dimensions

Institutional The Australian Institute of Health and Welfare (AIHW) is a major national agency set up

environment

by the Australian Government under the *Australian Institute of Health and Welfare Act* 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth)*, ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NESWTDC were supplied to the AlHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Elective surgery waiting times (removals data) is to collect information about patients waiting for elective surgery in public hospitals. The scope of this NMDS is patients removed from waiting lists for elective surgery (as either an elective or emergency case) which are managed by public acute hospitals. This includes private patients treated in public hospitals and may include public patients treated in private hospitals.

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

Analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 of usual residence of the patient.

The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, data represent the waiting time for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) for the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness Accuracy

The reference period for these data is 2013–14 and 2014–15. For 2013–14:

- Coverage of the NESWTDC was 93 per cent nationally, and 97 per cent or more in all states and territories except Victoria, where it was 77 per cent.
- Almost all public hospitals provided data for the NHMD in 2013–14, with the
 exception of all separations for a mothercraft hospital in the Australian Capital
 Territory. Approximately 96 per cent of NESWTDC records for removals for elective
 surgery were also provided in the Elective surgery waiting times cluster in the
 NHMD.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, and for individual surgical specialties and indicator procedures, as well as overall. Interpretation of waiting times for jurisdictions should take into consideration these differences.
- The Indigenous status data were sourced from the NHMD in 2013–14 for all jurisdictions.
- For 2009–10, the data for Albury Base Hospital (previously reported in New South Wales hospital statistics) was reported by the Victorian Department of Health as part of the Albury Wodonga Health Service. From 2010–11, the data for Albury Base Hospital have not been available.
- From 2011–12, South Australia and Western Australia provided data for a large number of smaller hospitals (32 and 22 respectively) that were not included in the data for previous years.
- For 2014–15, Queensland was not able to provide data for 2 hospitals (that reported about 7,000 admissions from elective surgery waiting lists in 2013–14) and 5 months of data for a third hospital (that reported about 3,700 admissions in 2013–14). In 2011–12, Queensland was not able to provide data for the same 3 hospitals and these hospitals reported data for only 3 of the 4 quarterly periods in 2012–13.
- The increase in admissions for the Northern Territory between 2010–11 and 2011–12 was, in part, due to the inclusion of certain surgical procedures from 2011–12 that had previously been incorrectly excluded from the NESWTDC by the Northern Territory.

Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual datasets are checked against data from other datasets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Cells based on fewer than 100 elective surgery admissions were suppressed.
- Cells based on data from one public hospital only were suppressed.

Coherence

Caution should be exercised when comparing waiting times data between jurisdictions due to differences in the assignment of clinical urgency categories (see *Australian hospital statistics 2013–14: elective surgery waiting times*, Appendix A http://www.aihw.gov.au/publication-detail/?id=60129549064).

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See

http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification. Data based on the current AIHW peer group classification has been backcast to 2011–12 for this report.

The data can be meaningfully compared across reference periods, except for the Indigenous disaggregation. Caution should be used in comparing data using the previous peer group classification across reference years, as the number of hospitals

classified as peer group A or B, or the peer group of a hospital, may vary over time. Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

The information presented for this indicator is based on the same data as published in, Australian hospital statistics 2013–14, Australian hospital statistics: elective surgery waiting times (report series.

The data reported for the 2013–14 and 2014–15 NEWSTDC are consistent with data reported for previous years for individual hospitals.

In addition, some 2013–14 data reported previously in these publications are different from the equivalent data published here depending upon the peer group classification used.

Caution should be exercised when interpreting the 2014–15 data as potential revisions to the 2014–15 NESWTDC data could occur following jurisdictional provision of elective surgery waiting times cluster data.

Analyses presented in *Australian hospital statistics* and previous *National Healthcare Agreement performance* reports may also differ slightly depending on whether the NESWTDC or linked NESWTDC/NHMD was used.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2011-12 reported by remoteness are reported for RA 2006. Data for 2012-13 and 2013-14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years. When comparing data over time, analyses based on data that has been linked to the NHMD should not be compared with analyses based on data sourced from the NESWTDC. In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level and data for 2012-13 are reported using SEIFA 2011 at the SA2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent

Accessibility

The AIHW provides a variety of products that draw upon the NESWTDC. Published products available on the AIHW website are the *Australian hospital statistics* suite of products with associated Excel tables.

These products may be accessed on the AIHW website http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the Elective Surgery Waiting Times (ESWT) NMDS and the Admitted patient care NMDS is published in the AlHW's online metadata repository, METeOR, and the *National health data dictionary*.

The National health data dictionary can be accessed online at: http://meteor.aihw.gov.au/content/index.phtml/itemId/268110

The Data Quality Statement for the 2013–14 NESWTDC can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592510

The Data Quality Statement for the 2013–14 NHMD can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/611030

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Comparisons across jurisdictions should be made with caution, due to differences in clinical practices and classification of patients across Australia. The measures are also affected by variations across jurisdictions in the method used to calculate waiting times for patients who transferred from a waiting list managed by one hospital to a waiting list managed by another hospital. For patients who were transferred from a waiting list managed by one hospital to that managed by another, the time waited on the first list is included in the waiting time reported in NSW, SA and the NT. This approach can have the effect of increasing the apparent waiting times for admissions in these jurisdictions compared with other jurisdictions.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, for individual surgical specialties and indicator procedures, influencing the overall total. For example, for 2013–14, the proportion of patients admitted from waiting lists who were assigned to Category 3 treatment clinically recommended within 365 days) was 43 per cent for NSW and 19 per cent for Queensland (Table B3.1 from Australian hospital statistics 2013–14: elective surgery waiting times, Appendix A online tables http://www.aihw.gov.au/publication-detail/?id=60129549064

Table A.1 Admissions from waiting lists for elective surgery, by clinical urgency category, states and territories, 2013-14 (per cent).

| | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Total |
|------------|-----|-----|-----|-----|-----|-----|-----|-----|-------|
| Category 1 | 24 | 29 | 39 | 25 | 25 | 38 | 29 | 30 | 29 |
| Category 2 | 33 | 48 | 42 | 37 | 36 | 42 | 44 | 48 | 40 |
| Category 3 | 43 | 23 | 19 | 38 | 39 | 20 | 26 | 22 | 32 |
| Total | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 |

Source: AIHW 2014. Australian hospital Statistics 2013–14: elective surgery waiting times. Health service series No.56. Cat. no. HSE 151.

- Interpretation of waiting times for jurisdictions should take into consideration these
 differences. For example, a state could report relatively long median waiting times
 in association with a relatively high proportion of patients assessed by clinicians in
 the state as being in Category 3. Conversely, a state in which a relatively high
 proportion of patients are assessed by clinicians as being in Category 1 or 2
 (treatment clinically recommended within 30 days and 90 days, respectively) could
 have relatively short median waiting times.
- Interpretation of waiting times for jurisdictions should take into consideration crossborder flows, particularly for the ACT.
- The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not directly comparable with data reported using the current AIHW peer group classification.

Waiting times for admission following emergency department care

Indicator definition and description

Element Effectiveness — access

Indicator Waiting times for admitted patient services — Waiting times for admission following

emergency department care

Measure (computation

'Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission to hospital is less than or equal to four hours.

Calculation includes presentations with any type of visit to emergency department. ED stay length is calculated by subtracting presentation time/date from physical departure time/date, which is recorded as per the business rules included in the NAPEDC NMDS 2013–14:

http://meteor.aihw.gov.au/content/index.phtml/itemId/509116

Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is calculated as:

Numerator: Number of ED presentations where ED stay is less than or equal to four hours ending in hospital admission.

Denominator: Number of ED presentations.

Calculation includes all presentations with an ED stay completed in the reporting period, including records where the presentation date/time is prior to the reporting period. Invalid records are excluded from the numerator and denominator. Invalid records are records for which:

- Length of stay < 0.
- Presentation date or time missing.
- Physical departure date or time missing.

Data source/s

This indicator is calculated using data from the Australian Institute of Health and Welfare's (AIHW's) NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC).

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care for non-admitted patients registered for care in emergency departments in selected public hospitals classified as either *Principal referral and Specialist women's and children's hospitals* (peer group A) or *Large hospitals* (peer group B). In 2012–13, hospitals in peer groups A and B provided over 86 per cent of all public hospital emergency presentations. In 2013–14, hospitals in peer groups A and B provided about 80 per cent of all public hospital emergency presentations. The data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD. Hospitals not included do not necessarily have emergency departments that are equivalent to those in hospitals in peer groups A and B. Data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

The financial year of 2011–12 is the first reporting period that these data are available according the agreed specification.

Accuracy

For 2012–13, the coverage of the NNAPEDCD was 100 per cent in all jurisdictions for public hospitals in peer groups A and B and is estimated at about 85 per cent for all hospitals.

For 2013–14, the preliminary estimate of the proportion of emergency occasions of service reported to the NNAPEDCD was 100 per cent for public hospitals in peer groups A and B and is estimated at about 88 per cent for all hospitals. In the baseline year (2007-08) for this indicator, the Tasmanian North West Regional Hospital comprised the combined activity of its Burnie Campus and its Mersey Campus. This hospital was a Peer Group B hospital. There was then a change in administrative arrangements for Mersey and it became the only hospital in the country owned and funded by the Australian Government and, by arrangement, operated by the Tasmanian Government. This administrative change necessitated reporting of these campuses as separate hospitals from 2008-09 onwards. On its own the North West Regional Hospital (Burnie Campus only) is a Peer Group B hospital, whilst, on its own the Mersey Community Hospital is a Peer Group C hospital. Burnie and Mersey did not substantially change their activity, rather, it is simply a case that activity is now spread across two hospitals. For National Healthcare Agreement purposes, although it is a Peer Group C hospital, the Mersey Community Hospital continues to be included in reporting for Peer Group B hospitals to ensure comparability over time for Tasmania. From 2009–10, data for the Albury Base Hospital (previously reported in NSW hospital statistics) were reported in Victorian hospital statistics. This reporting arrangement should be factored into any analysis of data for NSW and Victoria. States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible

Coherence

The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 with data reported for previous years.

data errors or missing or incorrect values.

For 2012–13, the scope of the Non-admitted patient emergency department care national minimum data set was non-admitted patients registered for care in emergency departments in selected public hospitals that are classified as either Peer Group A or B in the Australian Institute of Health and Welfare's *Australian Hospital Statistics* publication from the preceding financial year.

For 2013–14, the scope of the Non-admitted patient emergency department care national minimum data set specification (NAPEDC NMDS) is patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

 Purposely designed and equipped area with designated assessment, treatment and resuscitation areas.

- Ability to provide resuscitation, stabilisation and initial management of all emergencies.
- Availability of medical staff in the hospital 24 hours a day.
- Designated emergency department nursing staff and nursing unit manager 24 hours per day 7 days per week.

The data reported for 2012–13 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals.

In addition, the data reported to the NNAPEDCD in previous years has been consistent with the numbers of emergency occasions of services reported to the NPHED for each hospital for the same reference year.

Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.

The information presented for this indicator are calculated using the same methodology as data published in *Australian hospital statistics: emergency department care* (report series) and the *National Healthcare Agreement: performance report 2012–13.*

Accessibility

The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: Australian hospital statistics suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the NAPEDC NMDS and the NAPEDC Data Set Specification (DSS) are published in the AlHW's online metadata repository, METeOR, and the *National health data dictionary*.

The *National health data dictionary* can be accessed online at: http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the 2012–13 NNAPEDCD can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/546749

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The scope of the data used to produce this indicator is non-admitted patients
 registered for care in emergency departments in public hospitals reporting to the
 Non-admitted Patient Emergency Department Care (NAPEDC) National Minimum
 Data Set (NMDS) (Peer Groups A, B and other) as at August 2011 (when the
 National Health Reform Agreement National Partnership Agreement on Improving
 Public Hospital Services was signed).
- The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 with data reported for previous years.
- For 2012–13, the coverage of the National Non-admitted Patient Emergency
 Department Care Database (NNAPEDCD) collection is complete for public
 hospitals in peer groups A and B (*Principal referral and Specialist women's and children's hospitals* and *Large hospitals*) and is estimated at about 85 per cent for all hospitals.
- It is estimated that 2013–14 has similar coverage for public hospitals in peer groups A and B, and is estimated at about 88 per cent for all hospitals, although final coverage cannot be calculated until the 2013–14 National Public Hospital Establishments Database (NPHED) data are available.
- Caution should be used in comparing these data with earlier years as the number of reporting hospitals and the peer group for a hospital, may vary over time.

Separation rates for selected procedures

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness—appropriateness

Indicator Separation rates for selected procedures

MeasureThe numerator is the number of hospital separations involving the procedures:
(computation
cataract extraction, cholecystectomy, coronary artery bypass graft, coronary

angioplasty, cystoscopy, haemorrhoidectomy, hip replacement, inguinal herniorrhaphy, knee replacement, myringotomy, tonsillectomy, varicose veins

stripping and ligation, septoplasty, prostatectomy and hysterectomy.

The *denominator* is the Estimated Resident Population (ERP), with the exception of prostatectomy, where only the male ERP is used, and hysterectomy, where only the

female ERP aged 15-69 years is used.

A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation).

Calculation is 1000 × (numerator ÷ denominator), presented as a number per 1000 and age-standardised to the Australian population as at 30 June 2001 using 5-year age groups to 84 years, with ages over 84 combined. Aboriginal and Torres Strait Islander population data are not available for all states and territories for 5-year age groups beyond 64 years, so the Indigenous disaggregation was standardised to 64 years, with ages over 64 combined.

For hysterectomy only: Total population data were age-standardised using 5 year age groups between 15–69 years. Indigenous disaggregation was standardised to 64 years, with ages over 64 combined.

Data source/s Numerator:

This indicator is calculated using data from the NHMD, based on the National Minimum Data Set for Admitted patient care.

Denominator.

For total population: Australian Bureau of Statistics (ABS) ERP as at 30 June 2011.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with

respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Aboriginal and Torres Strait Islander and Other Australians' rates of hysterectomy in Tasmania and the ACT may underestimate rates of hysterectomy for women aged 15–69 years due to the age-standardisation method used (see above).

Timeliness Accuracy

The reference period for these data is 2013–14.

For 2013–14 almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT.

The majority of private hospitals provided data, with the exception of the private free-standing day hospitals in the ACT and the NT.

Coronary artery bypass graft and coronary angioplasty are not performed in NT hospitals. Residents of the NT requiring these procedures receive treatment interstate. States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Data on procedures are recorded uniformly using the Australian Classification of Health Interventions.

Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 1000.
- Data for private hospitals in Tasmania, the ACT and the NT were suppressed.
- Rates which appear misleading (for example, because of cross border flows) were also suppressed.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*.

The data can be meaningfully compared across reference periods for all jurisdictions except Tasmania. 2008–09 data for Tasmania does not include two private hospitals

that were included in 2007–08 and 2009–10 data reported in National Healthcare Agreement performance reports. In 2009-10, WA was missing 2400 separations for one public hospital and was not able to provide about 10 600 separations for one private hospital.

Caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. The AIHW consider the change from SEIFA 2006 to SEIFA 2011 to be a series break when applied to data supplied for this indicator, therefore SEIFA data for 2011-12 are not directly comparable with SEIFA data from previous reporting cycles.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- · Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).
- Data are also included on the MyHospitals website.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AlHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Admitted patient care is published in the AlHW's online metadata repository METeOR and the *National health data dictionary*.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

Higher/lower rates are not necessarily associated with inappropriate care. However, large jurisdictional variations in rates for particular procedures can require investigation to determine whether service levels are appropriate.

Care needs to be taken when interpreting the differences in the separation rates for the selected procedures. Variations in rates can be attributable to variations in the prevalence of the conditions being treated, or to differences in clinical practice across states and territories. Higher rates can be acceptable for certain conditions and not for others. Higher rates of angioplasties, for example, can represent appropriate levels of care, whereas higher rates of hysterectomies or tonsillectomies can represent an over-reliance on procedures. Some of the selected procedures, such as angioplasty and coronary artery bypass graft, are alternative treatment options for people diagnosed with similar conditions.

Selected unplanned hospital readmission rates

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element

Effectiveness — quality/safety

Indicator

Selected unplanned/unexpected readmissions within 28 days of selected surgical admissions.

For the 2013 report, the National Health Information Standards and Statistics Committee (NHISSC), on behalf of Australian Health Ministers' Conference, amended the title of this indicator in the NHISSC specifications to: *Unplanned hospital readmission rates* to better reflect how the indicator is calculated. Readmissions for this indicator are defined within 28 days from the end of the patient's surgical episode of care.

Measure (computation

Numerator: the number of separations for public hospitals which meet all of the following criteria:

- the separation is a readmission to the same hospital following a separation in which one of the following procedures was performed: knee replacement; hip replacement; tonsillectomy and adenoidectomy; hysterectomy; prostatectomy; cataract surgery; appendicectomy
- the readmission occurs within 28 days of the previous date of separation
- the principal diagnosis for the readmission is a post-operative complication.

Denominator: the number of separations in which one of the following surgical procedures was undertaken: knee replacement; hip replacement; tonsillectomy and adenoidectomy; hysterectomy; prostatectomy; cataract surgery; appendicectomy.

The denominator is limited to separations with a separation date between 1 July and 19 May in the reference year.

Data source/s

For all jurisdictions except WA, this indicator is calculated by the Australian Institute of Health and Welfare (AIHW) using data from the NHMD, based on the Admitted patient care national minimum data set (NMDS).

For WA, the indicator was calculated and supplied by WA Health and was not independently verified by the AIHW.

<u>For data by socioeconomic status</u>: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area level 2 (SA2) as at 30 June 2013. Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

<u>For data by remoteness</u>: each separation is allocated an ABS remoteness area, as specified in the Australian Standard Geographical Classification, based on the SA2 of usual residence of the patient.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in

administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

The analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 (SA2) of usual residence of the patient. The Socio-Economic Indexes for Areas (SEIFA) categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, rates represent the number of separations for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) divided by the total number of separations for people living in that remoteness area or SEIFA population group and hospitalised in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

The unplanned and/or unexpected readmissions counted in the computation for this indicator have been limited to those having a principal diagnosis of a post-operative adverse event for which a specified ICD-10-AM diagnosis code has been assigned. Unplanned and/or unexpected readmissions attributable to other causes have not been included.

With regard to hysterectomy, there are three related procedures that are not defined for the indicator, and therefore have not been included in any *National Healthcare Agreement* (NHA) reporting (all years). These are (in ICD-10-AM 8th edition), 35750-00—Laparoscopically assisted vaginal hysterectomy; 35753-02—Laparoscopically assisted vaginal hysterectomy with removal of adnexa; 35653-00—Subtotal abdominal hysterectomy; and 90448-00—Subtotal laparoscopic abdominal hysterectomy. For public hospitals, there were 1777 separations in 2013–14 that involved one of these procedures.

The calculation of the indicator is limited to public hospitals and to readmissions to the same hospital.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness

The reference period for this data set is 2013–14.

Accuracy

For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

The AIHW report *Indigenous identification in hospital separations data: quality report* (AIHW 2013) found that nationally, about 88% of Indigenous Australians were identified correctly in hospital admissions data in the 2011–12 study period, and the 'true' number of separations for Indigenous Australians was about 9 per cent higher than reported. The report recommended that the data for all jurisdictions are used in analysis of Indigenous hospitalisation rates, for hospitalisations in total in national analyses of Indigenous admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status

For this indicator, the linkage of separations records is based on the patient identifiers which are reported for public hospitals. As a consequence, only readmissions to the same public hospital are in scope; and readmissions to different public hospitals and readmissions involving private hospitals are not included.

For Western Australia the indicator was calculated and supplied by Western Australia Health.

To calculate this indicator, readmissions within the 2013–14 financial year had to be linked to an initial separation (which involved the specified surgery) that occurred within the 2013–14 financial year. The 19 May was specified as the cut-off date for the initial separation to exclude initial separations from the denominator for which a readmission may occur in the following financial year. The use of the cut-off date ensures that the numerator and denominator for this indicator are consistent.

Data on procedures are recorded uniformly using the Australian Classification of Health Interventions. Data on diagnoses are recorded uniformly using the ICD-10-AM. Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 200.
- Rates were suppressed where the numerator was zero and the denominator was less than 200.
- Counts were suppressed when the number was less than 5.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Australian hospital statistics 2013–14*.

The data can be meaningfully compared across reference periods for all jurisdictions. However, caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See

http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports was calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification. Data based on the current AIHW peer group classification has been backcast to 2007–08 for this report.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data

disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remotieness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012-13 and 2013-14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years. In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010–11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. Data for 2012-13 are reported using SEIFA 2011 at the Statistical Area level 2 (SA2). The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012-13 and subsequent

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AlHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Indigenous data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AlHW's online metadata repository, METeOR, and the *National health data dictionary*.

The National health data dictionary can be accessed online at: http://meteor.aihw.gov.au/content/index.phtml/itemId/268110
The Data Quality Statement for the 2013–14 NHMD can be accessed.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- The National Hospital Morbidity Database (NHMD) is a comprehensive data set that has records for all separations of admitted patients from essentially all public and private hospitals in Australia.
- The indicator is an underestimate of all possible unplanned/unexpected readmissions because:
- it could only be calculated for public hospitals and for readmissions to the same hospital.
- episodes of non-admitted patient care provided in outpatient clinics or emergency departments which may have been related to a previous admission are not included.
- the unplanned and/or unexpected readmissions are limited to those having a principal diagnosis of a post-operative adverse event for which a specified International Statistical Classification of Diseases and Related Health Problems,

Tenth Revision, Australian Modification (ICD-10-AM) diagnosis code has been assigned. This does not include all possible unplanned/unexpected readmissions.

- Calculation of the indicator for WA was not possible using data from the NHMD.
 Data for WA were supplied by WA Health and Australian rates and numbers do not include WA.
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Adverse events in public hospitals

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Selected healthcare-associated infections

Indicator definition and description

Element Effectiveness — quality/safety

IndicatorAdverse eventMeasureSAB patient episod(computationPatient episod

Adverse events in public hospitals — Selected healthcare-associated *infections*. SAB patient episodes (as defined below) associated with acute care public hospitals. Patient episodes associated with care provided by private hospitals and non-hospital

healthcare are excluded.

The definition of an acute public hospital is 'all public hospitals including those hospitals defined as public psychiatric hospitals in the Public Hospital Establishments NMDS'

All types of public hospitals are included, both those focusing on acute care, and those focusing on non-acute or sub-acute care, including psychiatric, rehabilitation and palliative care.

Unqualified newborns are included in the indicator. Hospital boarders and posthumous organ procurement are excluded from the indicator.

A patient episode of SAB is defined as a positive blood culture for *Staphylococcus aureus*. For surveillance purposes, only the first isolate per patient is counted, unless at least 14 days has passed without a positive blood culture, after which an additional episode is recorded.

A *Staphylococcus aureus* bacteraemia will be considered to be healthcare-associated if: the first positive blood culture is collected more than 48 hours after hospital admission or less than 48 hours after discharge, OR, if the first positive blood culture is collected 48 hours or less after admission and one or more of the following key clinical criteria was met for the patient-episode of SAB:

- 1. SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter)
- 2. SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site
- 3. An invasive instrumentation or incision related to the SAB was performed within 48 hours
- 4. SAB is associated with neutropenia (<1 x 10⁹) contributed to by cytotoxic therapy This definition of a patient episode of SAB was agreed by all states and territories and used by all states and territories for reporting for 2010-11 and subsequent years. The *denominator* is number of patient days for public acute care hospitals (only for

hospitals included in the surveillance arrangements).

Calculation is 10 000 × (Numerator ÷ Denominator), presented as a number per 10 000 and number only.

Coverage: Denominator ÷ Number of patient days for all public hospitals in the State or Territory.

Data source/s

Numerator: State and Territory healthcare-associated infection surveillance data.

Denominator: State and Territory admitted patient data.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) calculated the indicator from data provided by states and territories.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister. For further information see the AIHW website.

The data supplied by the states and territories were collected from hospitals through the healthcare associated infection surveillance programs run by the states and territories. The arrangements for the collection of data by hospitals and the reporting to State and Territory health authorities vary among the jurisdictions.

Relevance

This indicator is for patient episodes of SAB acquired, diagnosed and treated in public acute care hospitals. The definition of a public acute care hospital is 'all public hospitals including those hospitals defined as public psychiatric hospitals in the Public Hospital Establishments NMDS'. All types of public hospitals are included, both those focusing on acute care, and those focusing on non-acute or sub-acute care, including psychiatric, rehabilitation and palliative care. The provision of 'acute' services varies among jurisdictions, so it is not possible to exclude 'non-acute' hospitals from the indicator in a way that would be uniform among the states and territories. Therefore all public hospitals have been included in the scope of the indicator so that the same approach is taken for each State and Territory.

The SAB patient episodes reported were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). No denominator is available to describe the total admitted and non-admitted patient activity of public hospitals. However, the number of patient days for admitted patient activity is used as the denominator to take into account the large differences between the sizes of the public hospital sectors among the jurisdictions. The accuracy and comparability of the SAB rates among jurisdictions and over time is limited because the count of patient days reflects the amount of admitted patient activity, but does not reflect the amount of non-admitted patient activity. The amount of hospital activity that patient days reflect varies among jurisdictions and over time because of variation in admission practices.

In 2012, the scope of the indicator was revised to include unqualified newborns. Data reported for 2010–11 and subsequent years include unqualified newborns. It is not possible to backcast the data for earlier years.

Only patient episodes associated with public acute care hospitals in each jurisdiction are counted. If a case is associated with care provided in another jurisdiction then it may be reported (where known) by the jurisdiction where the care associated with the SAB occurred.

Almost all patient episodes of SAB will be diagnosed when the patient is an admitted patient. However, the intention is that patient episodes are reported whether they were determined to be associated with admitted patient care or non-admitted patient care in public acute care hospitals.

Processes and capacity to validate a patient episode of SAB may vary between states and territories.

The data presented have not been adjusted for any differences in case-mix between the states and territories.

Analysis by state/territory is based on the location of the hospital.

No denominator is available to describe the total admitted and non-admitted patient activity of public hospitals. However, the number of patient days for admitted patient activity is used as the denominator to take into account the large differences between the sizes of the public hospital sectors among the jurisdictions. Patient days are used rather than occupied bed days because occupied bed day data were not available for all states and territories and there is no nationally agreed definition for occupied bed days.

Timeliness

The reference period for these data is 2014–15, with revised data provided for 2013–14.

Accuracy

For some states and territories there is less than 100 percent coverage of public hospitals. For those jurisdictions with incomplete coverage of public hospitals (in the numerator), only patient days for those hospitals (or parts of hospitals) that contribute data are included (in the denominator). Differences in the types of hospitals not included may impact on the accuracy and comparability of rates.

For 2010–11 and previous years, data for Queensland include only patients aged 14 years and over.

Sometimes it is difficult to determine if a case of SAB is associated with care provided by a particular hospital. Counts therefore may not be precise where cases are incorrectly included or excluded. However, it is likely that the number of cases incorrectly included or excluded would be small.

It is possible that there will be less risk of SAB in hospitals not included in the SAB surveillance arrangements, especially if such hospitals undertake fewer invasive procedures than those hospitals which are included.

There may be imprecise exclusion of private hospital and non-hospital patient episodes due to the inherent difficulties in determining the origins of SAB episodes.

For 2010–11 and subsequent years, all states and territories used the definition of SAB patient episodes associated with acute care public hospitals as defined above.

The patient day data may be preliminary for some hospitals/jurisdictions.

New South Wales does not provide patient day data, but rather occupied bed days. There may be some difference between patient days and occupied bed days. Some states and territories have provided revised data for 2013–14, thus a revised table for 2013–14 is provided.

Coherence

National data for this indicator were first presented in the 2010 COAG Reform Council report. Since that report further work has been undertaken on data development for this indicator, including the definition of an episode of SAB and a suitable denominator, as well as the coverage of public hospitals. The most recent work in 2012 was to revise the scope of the indicator to include unqualified newborns. Data reported for 2010–11 and subsequent years include unqualified newborns. It is not possible to backcast the data for earlier years. Data for 2014–15, 2013–14, 2012–13, 2011–12 and 2010–11 are therefore not comparable with data for previous years.

Data for 2010–11 and 2011–12 are comparable, except for Queensland, where the 2010–11 data do not include patients aged 13 years and under, whereas the 2011–12 data include patients of all ages.

Data for 2011–12, 2012–13, 2013–14 and 2014–15 are comparable.

New South Wales data for 2010–11, 2011–12, 2012–13, 2013–14 and 2014–15 are not comparable with data from other jurisdictions because New South Wales uses occupied bed days, rather than patient days, for calculation of the denominator.

New South Wales data are included in Australian totals for 2010–11, 2011–12, 2012–13, 2013–14 and 2014–15 because it is expected that at the national level the use of occupied bed days, rather than patient days, for NSW is unlikely to create a marked difference in the Australian data.

As 2008–09 data were provided prior to the development of agreed national definitions, by only five jurisdictions, and was limited to principal referral and large hospitals, these data are not comparable with 2009–10 data, except for Tasmania.

Some jurisdictions have previously published related data (see Accessibility above).

Accessibility

The following states and territories publish data relating to healthcare-associated SAB in various report formats on their websites:

New South Wales: *Healthcare associated infections reporting* for 8 infection indicators by state.

http://www.health.nsw.gov.au/professionals/hai/Documents/

HAI-data-collection-report-2014.pdf

Western Australia: Healthcare Associated Infection Unit - Annual Report and aggregate reports

http://www.public.health.wa.gov.au/3/455/3/

reports healthcare associated infection unit.pm

South Australia: Healthcare Associated Bloodstream Infection Report.

http://www.sahealth.sa.gov.au/wps/wcm/connect/public+content/sa+health+internet/about+us/health+statistics/healthcare+infection+statistics

Tasmania: Acute public hospitals healthcare associated infection surveillance report. http://www.dhhs.tas.gov.au/peh/tasmanian_infection_prevention_and_control_unit/publications_and_guidelines

Interpretability

Jurisdictional manuals should be referred to for full details of the definitions used in healthcare-associated infection surveillance.

Definitions for this indicator are published in the performance indicator specifications.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- There may be imprecise exclusion of private hospital and non-hospital patient episodes due to the inherent difficulties in determining the origins of SAB episodes.
- For some states and territories there is less than 100 per cent coverage of public hospitals. For those jurisdictions with incomplete coverage of public hospitals (in the numerator), only patient days for those hospitals that contribute data are included (in the denominator). Differences in the types of hospitals not included may impact on the accuracy and comparability of rates.
- The accuracy and comparability of the rates of SAB among jurisdictions and over time is also limited because the count of patient days (denominator) reflects the amount of admitted patient activity, but does not reflect the amount of non-admitted patient activity.
- The data for 2014–15, 2013–14, 2012–13 and 2011–12 are comparable.
- The data for 2011–12 are comparable with those from 2010–11 except for
- New South Wales data for 2010-11, 2011-12, 2012-13, 2013-14 and 2014-15 are not comparable with other jurisdictions.
- The patient day data may be preliminary for some hospitals/jurisdictions.

Adverse events treated in hospitals

Indicator definition and description

Element

Effectiveness — quality/safety

Indicator

Adverse events in public hospitals — Adverse events treated in hospitals

Measure (computation Adverse events treated in hospitals are measured by separations that had an adverse event including infections, falls resulting in injuries and problems with medication and medical devices that occurred during a hospitalisation. Hospitalisation is identified by diagnoses, places of occurrence and external causes of injury and poisoning that can indicate that an adverse event was treated and/or occurred during the hospitalisation.

Data source/s

This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and nongovernment organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with

compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness Accuracy

The reference period for this data set is 2013-14.

For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Hospital separations data include information on diagnoses, places of occurrence and external causes of injury and poisoning that can indicate that an adverse event was treated and/or occurred during the hospitalisation. However, other diagnosis codes may also suggest that an adverse event has occurred, and some adverse events are not identifiable using these codes. A separation may be recorded against more than one category as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning).

The data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included in these tables may represent events that occurred before admission. Condition onset flag (COF) information (see *Australian hospital statistics 2012–13*, Chapter 6 and Appendix B) can be used to provide other information about adverse events occurring, and treated within, single episodes of care.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*.

The data can be meaningfully compared across reference periods for all jurisdictions.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the National Hospital Morbidity Database can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues The Steering Committee notes the following issues:

A separation may be recorded against more than one category as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning).

These data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included may represent events that occurred before admission.

Some adverse events are not identifiable using the codes for an adverse event or a place of occurrence of hospital. Some other diagnosis codes may suggest that an adverse event has occurred when it has not.

Falls resulting in patient harm in hospitals

Indicator definition and description

Element

Indicator

Effectiveness — quality/safety

Measure

Adverse events in public hospitals — Falls resulting in patient harm in hospitals

Numerator: Number of hospital separations with an external cause code for a fall and

a place of occurrence of health service area. (computation

Denominator. Total number of hospital separations.

A fall is identified by ICD-10-AM external cause codes W00, W01, W03-W11, W13, W14, W16-W19. Excluded from the numerator are those separations where the ICD-10-AM code for the principal diagnosis is in the range of S00 to T14 (inclusive). Also excluded from the numerator are separations where the principal diagnosis has the ICD-10-AM code Z50.9 (Care involving use of rehabilitation procedure, unspecified) and the second diagnosis is in the range of S00 to T14 (inclusive).

A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death) or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation).

Calculation: Numerator only; and 1000 × (numerator ÷ denominator)

Data source/s

This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care.

For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Local Area (SLA) as at 30 June 2011. Each SLA in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population.

For data by remoteness: each separation is allocated an ABS remoteness area, as

specified in the Australian Standard Geographical Classification, based on the SLA of usual residence of the patient.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

The analyses by remoteness and socioeconomic status are based on the Statistical Local Area (SLA) of usual residence of the patient. The Socio-Economic Indexes for Areas (SEIFA) categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SLA are derived from 2011 Census data and represent the attributes of the population in that SLA in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, rates represent the number of separations for patients

living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) divided by the total number of separations for people living in that remoteness area or SEIFA population group and hospitalised in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness Accuracy

The reference period for this data set is 2013–14.

For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

The AIHW report Indigenous identification in hospital separations data: quality report (AIHW 2013) found that nationally, about 88 per cent of Aboriginal and Torres Strait Islander Australians were identified correctly in hospital admissions data in the 2011–12 study period, and the 'true' number of separations for Aboriginal and Torres Strait Islander Australians was about 9 per cent higher than reported. The report recommended that the data for all jurisdictions are used in analysis of Aboriginal and Torres Strait Islander hospitalisation rates, for hospitalisations in total in national analyses of Aboriginal and Torres Strait Islander admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status data.

The specification for the indicator defines a fall in hospital as being one for which the place of occurrence is coded as *Health service area*. The *Health service area* as a place of occurrence is broader in scope than hospitals—it includes other health service settings such as day surgery centres and hospices. Hence the numbers presented could be an overestimate as they include falls in health care settings other than hospitals.

Around 26 per cent of the records of separations involving falls did not have a code assigned for the place of occurrence. Consequently, the recorded number of falls occurring in hospitals may be an underestimate.

For separations having multiple external causes, it is not possible to establish (from the NHMD) whether the nominated place of occurrence is associated with the fall or with some other external cause. As a consequence, the count of separations may also be overestimated.

To minimise the chance of overestimation, separations where a person was admitted to hospital with a principal diagnosis of an injury were excluded on the basis that if the injury was the principal diagnosis it was associated with an external cause relating to an event occurring prior to admission. However, these exclusions may result in an underestimation of the indicator as the indicator does not count separations where a person is injured and admitted to hospital and then subsequently experiences a fall in hospital.

Data on falls are recorded uniformly using the ICD-10-AM.

The indicator provides a count of separations involving one or more falls. It does not provide a count of falls.

Comparability is affected by data not being adjusted for differences in casemix (for example, patient age).

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5.
- Data for private hospitals in Tasmania, ACT and the NT were suppressed.

Coherence

The information presented for this indicator is calculated using the same methodology

as data published in Australian hospital statistics 2012-13.

The data can be meaningfully compared across reference periods for all jurisdictions except Tasmania. 2008–09 data for Tasmania does not include two private hospitals that were included in 2007–08 and 2009–10 data reported in the National Healthcare Agreement performance reports.

Caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. The AIHW consider the change from SEIFA 2006 to SEIFA 2011 to be a series break when applied to data supplied for this indicator, therefore SEIFA data for 2011-12 are not directly comparable with SEIFA data from previous reporting cycles.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- · Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the National Hospital Morbidity Database can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

The recorded number of falls occurring in hospitals may be an underestimate as around 26 per cent of the records of separations involving falls did not have a code assigned for the place of occurrence.

Underestimation and overestimation may also have occurred due to other limitations of the data.

The indicator provides a count of separations involving one or more falls. It does not provide a count of falls.

Comparability is affected by data not being adjusted for differences in casemix (for

example, patient age).

Data on Indigenous status reported for Tasmania and the ACT should be interpreted with caution until an assessment of Indigenous identification is completed.

Workforce sustainability

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Efficiency — sustainability **Indicator** Workforce sustainability

Measure Workforce sustainability reports age profiles for nurse and midwife, medical

(computation practitioner, dental practitioner and allied health practitioner workforces. It shows the

numbers of each of these registered professions in ten year age brackets, both by jurisdiction and by region.

Data source/s National Health Workforce Data Set: medical practitioners 2014

National Health Workforce Data Set: nurses and midwives 2014 National Health Workforce Data Set: allied health practitioners 2014

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator using estimates derived from the National Health Workforce Data Set (NHWDS). The NHWDS is developed through the collaboration of three agencies.

The Australian Health Practitioner Regulation Agency (AHPRA) is the organisation responsible for the implementation of the National Registration and Accreditation Scheme (NRAS) across Australia, including collecting registration data and administering the workforce surveys.

Health Workforce Australia was responsible for the development of the health workforce surveys until its closure by the Australian Government on 6 August 2014. The Australian Government Department of Health now performs this function.

The AIHW receives registration and survey data from the AHPRA. The registration and workforce survey data are combined, cleansed and adjusted for non-response to form the NHWDS, and the findings reported by profession. AIHW is the data custodian of the NHWDS. These data are used for workforce planning, monitoring and reporting.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister. For further information, see the AIHW website.

Relevance

Medical practitioners, nurses/midwives and allied health practitioners are required by law to be registered with their relevant national board to practise in Australia. All medical practitioners, nurses/midwives and nominated allied health practitioners must complete the formal registration renewal form(s) to practise in Australia. This is the compulsory component of the renewal process. The exception is Aboriginal and Torres Strait Islander health practitioners in the allied health workforce; where those who are not required by their employer to use the title 'Aboriginal and Torres Strait Islander health practitioner', 'Aboriginal health practitioner' or 'Torres Strait Islander health practitioner' are not required to be registered, and can continue to work using their current titles (e.g. 'Aboriginal health worker', 'drug and alcohol worker' and 'mental health worker').

The health workforce surveys for each of these professions is voluntary and only practitioners who renew their registration receive a questionnaire for completion. New registrants will not receive a survey form until they renew their registration the following year, during the registration renewal period. Practitioners with registration type of 'Limited' (referred to as 'limited registration') are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year.

National Health Workforce Data Set: medical practitioners 2014

The NHWDS: medical practitioners 2014 contain registration details of all registered medical practitioners in Australia, at 30 September on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data of respondents obtained from the Medical Workforce Survey 2014.

National Health Workforce Data Set: nurses and midwives 2014

The NHWDS: nurses and midwives 2014 contain registration details of all registered nurses/midwives in Australia at 31 May on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data obtained from the Nursing and Midwifery Workforce Survey 2014.

National Health Workforce Data Set: allied health practitioners 2014

The NHWDS: allied health practitioners 2014 contain registration details of all registered allied health practitioners in Australia, at 30 November on the annual renewal date. Data were extracted from the AHPRA database at the end of January the following year. The NHWDS also contains workforce data obtained from each profession-specific health workforce survey.

Allied health professions not in the National Registration and Accreditation Scheme are not included in the data set (e.g. sonographers and optical technicians).

The dental practitioner workforce data is part of the NHWDS: allied health practitioners 2014. The dental practitioner workforce is comprised of 5 types of practitioners: dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists. Dental practitioners may register in more than 1 practitioner type, resulting in double counting of practitioners. For the purposes of this indicator, data for the dental practitioner workforce is for dentists only—the other practitioner types are excluded.

Indicator data reported for allied health practitioners are comparable between 2013 and 2014. The same professions were included in both years. And, data for both years do not include dental practitioners which are reported separately. However, indicator data for allied health practitioners are not comparable between 2012 and 2013. Due to transitional arrangements with the migration of data from state and territory-based systems to NRAS, in 2012, many medical radiation practitioners in Queensland, Western Australia and Tasmania were not required to renew their registrations and, as a result did not complete a workforce survey. As a consequence, data for Queensland, Western Australia and Tasmania for this profession are excluded from the indicator data for allied health practitioners.

For the same reason, occupational therapists in Queensland, Western Australia and South Australia are excluded from the indicator data for allied health practitioners in 2012.

Timeliness

National Health Workforce Data Set:

The NHWDS for each of the registered professions will be produced annually during the national registration renewal process. Each profession will also be administered a Workforce Survey as part of the registration renewal process.

-Medical practitioners 2014

The NHWDS: medical practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 July and 30 September each year, including the collection of the Medical Workforce Survey.

-Nurses and midwives 2014

The NHWDS: nurses and midwives is produced annually from information collected by the national registration renewal process, conducted between 1 April and 31 May each year, including the collection of the Nursing and Midwifery Workforce Survey.

—Allied health practitioners 2014

The NHWDS: allied health practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 September and 30 November each year, including the collection of the profession-specific workforce surveys. Practitioners with limited registration are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year.

This data set includes the dental practitioner workforce, which is comprised of dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists.

Accuracy

Data manipulation and estimation processes

The registration and workforce survey data for each health profession are combined, cleansed and adjusted for non-response to form the National Health Workforce Data Set (NHWDS). The cleaning and editing procedures included range and logic checks, clerical scrutiny at unit record level, and validation of unit record and aggregate data.

Imputation methods are used to account for item non-response and survey non-response. In 2013, the methodology for survey non-response was changed from a weighting-based methodology to a randomised sequential hot deck-based imputation.

It should be noted that both of these kinds of non-response is likely to introduce some bias in the estimates and any bias is likely to become more pronounced when response rates are low or when estimates are based on a small number of records. Care should be taken when drawing conclusions about the size of the differences between estimates

As a result of the estimation method to adjust for non-response, numbers of medical practitioners, nurses/midwives or allied health practitioners may have been in fractions, but have been rounded to whole numbers for this indicator. The full-time equivalent rate calculations are based on rounded numbers.

Registration data from the National Registration and Accreditation Scheme (NRAS)

Registration details were migrated from the respective state and territory professional board (or council) for practitioners with registrations expiring after the official AHPRA closing date for their profession.

Some data items previously collected by the AIHW Labour Force Surveys are now collected by the NRAS. However, some data quality issues due to migrated data items from the respective state and territory health profession boards may have affected the weighting method.

Medical practitioners, nurses/midwives and allied health practitioners who reside overseas have been included with practitioners whose state or territory of principal practice and state or territory of main job, respectively, could not be determined.

Health Workforce Survey

In 2013, the online survey questionnaire included for the first time electronic sequencing of questions to automatically guide the respondent to the next appropriate question based on previous responses to questions.

The online survey questionnaire prior to 2013 and in the paper version of the questionnaire, respondents may have made inconsistent responses by not correctly following the sequencing instructions.

The order of the response categories for some questions may have also impacted on the accuracy of the information captured. In addition, there was variation in some responses between the online and paper surveys.

NHWDS data by profession

The following should be noted when comparing state and territory indicator data:

- The data include employed professionals who did not state or adequately describe their state of principal practice and employed professionals who reside overseas.
 The national estimates include this group.
- National Health Workforce Data Set: medical practitioners 2014: The overall response rate (excludes provisional registrants) of medical practitioners for 2014 was 91.8 per cent.
- National Health Workforce Data Set: nurses and midwives 2014: The overall response rate of nurses and midwives for 2014 was 93.4 per cent.
- National Health Workforce Data Set: allied health practitioners 2014:
 - For indicator data representing dental practitioners, represented by dentists, the response rate for 2014 was 92.2 per cent.
 - For indicator data representing allied health practitioners (excluding dental practitioners) in 2014 was 92.9 per cent. The response rate excludes provisional registrants.

Coherence

Health Workforce Survey—coherence with previous surveys

Labour force data published by the AIHW before the NRAS was established in July

2010 were the result of collated jurisdiction-level occupation-specific surveys. The current Health Workforce Survey gathers similar information from each professional group through a separate questionnaire, tailored slightly to take account of profession-specific responses to certain questions, e.g. work setting of main job.

For this indicator, the workforce surveys for medical practitioners, nurses/midwives and allied health practitioners collect similar data items, but the methodology differs from previous years. The AHPRA is now the single source of registered practitioner data instead of eight state and territories bodies for each profession, and there is greater consistency between jurisdictions and years in the scope of registration information.

The scope and coverage of the Health Workforce Survey is also different from that of the previous series of AIHW Labour Force Surveys as not all jurisdictions surveyed all types of registered health practitioners.

If the location of principal practice recorded in the registration data was different from the corresponding details of their main job self-reported by practitioners in the survey, the location was derived hierarchically based on main job information and then on principal practice location then place of residence.

Date of birth is one of many data items previously collected by the AIHW Labour Force Surveys, which is now collected by the NRAS.

The three employment-related questions in the new survey are now nationally consistent, but vary from the previous AIHW Labour Force Survey. Due to the differences in data collection (including survey design and questionnaire), processing and estimation methods, it is recommended that comparisons between workforce data from the NHWDS and the previous AIHW Labour Force Survey be made with caution.

AIHW Published Numbers

For this indicator, the rates are based on practitioners employed in the medical, allied health and nursing and midwifery workforces, which is consistent with data published in AIHW's workforce output products available online.

Accessibility

Published products available on the AIHW website include workforce online webpages, survey questionnaires and supplementary detailed tables. User guides to the data sets are available on request from the AIHW.

Interpretability

Explanatory information for the Medical Workforce Survey, Dental Workforce Survey and the Nursing and Midwifery Workforce Survey is contained in the published online webpages, supplementary detailed tables and data quality statements to the data set for each profession. For the allied health professions, information about their workforce surveys is available in the National Health Workforce Data Set: allied health practitioners data quality statement. This includes collection method, scope and coverage, survey response, imputation and weighting procedures, and assessment of data quality (including comparison with other data sources).

These are available via the AIHW website and readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- These measures are not a substitute for a full workforce analysis that allows for migration, trends in full-time work and expected demand increases. The indicator does not provide information on those currently in training and the intentions of those in the medical workforce to leave the workforce in the near future.
- Due to the differences in data collection, processing and estimation methods, including survey design and questionnaire, it is recommended that comparisons between workforce data from the National Health Workforce Data Set (NHWDS) and the previous Australian Institute of Health and Welfare (AIHW) Labour Force Survey be made with caution and noted in any analyses.
- Results for the indicator are estimates because the survey data have undergone
 imputation to adjust for non-response. It should be noted that any of these
 adjustments may have introduced some bias in the estimates and any bias is likely
 to become more pronounced when response rates are low or when estimates are
 based on a small number of survey records. Care should be taken when drawing
 conclusions about the size of the differences between estimates.
- The 2014 allied health workforce indicator data exclude provisional registrants in professions where provisional registration is available (osteopaths, medical

radiation practitioners, occupational therapists, pharmacists and psychologists).

- The 2014 medical workforce indicator data exclude provisional registrants.
- There is no provisional registration type for dental practitioners (dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists), nurses and midwives.

Relative stay index

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element

Efficiency

Indicator

Relative Stay Index

Measure (computation

Relative stay indexes (RSIs) are calculated as the number of observed patient days' for separations in selected AR-DRGs, divided by the number of expected patient days', standardised for casemix (based on national figures). An RSI greater than 1.0 indicates that an average patient's length of stay is higher than expected given the casemix for the group of separations of interest. An RSI of less than 1.0 indicates that the length of stay was less than expected.

The standardisation for casemix (based on AR-DRG version 6.0x and the age of the patient for each separation) allows comparisons to be made that take into account variation in types of services provided; however, it does not take into account other influences on length of stay, such as Indigenous status.

The RSI method includes acute care separations only, and excludes separations for patients who died or were transferred within 2 days of admission, or with a length of stay greater than 120 days. Excluded from the analysis were:

- AR-DRGs for rehabilitation (such as Z60A Rehabilitation with catastrophic/severe complications or comorbidities)
- predominantly same-day AR-DRGs (such as R63Z Chemotherapy and L61Z Admit for renal dialysis)
- AR-DRGs with a length of stay component in the definition
- Error AR-DRGs

Data source/s

The NHMD is the source of data on casemix adjusted separations for public hospitals. The NHMD is based on the NMDS for Admitted patient care.

Casemix adjusted separations are calculated by the application of cost weights sourced from the Independent Hospital Pricing Authority's National Hospital Cost Data Collection for each separation's recorded AR-DRG.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in all public and private acute and psychiatric hospitals, free-standing day hospital facilities and alcohol and drug treatment centres in Australia. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories may also be included. Hospitals specialising in dental, ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

The scope of the analysis includes public hospitals that provide mainly acute care. These are the hospitals in the public hospital peer groups of Principal referral and specialist women's and children's hospitals, Large hospitals, Medium hospitals, and Small acute hospitals. Excluded are Small non-acute hospitals, Multi-purpose services, Hospices, Rehabilitation hospitals, Mothercraft hospitals, Other non-acute hospitals, Psychiatric hospitals, and hospitals in the Unpeered and other hospitals peer group. Also excluded are hospitals for which expenditure or admitted patient care data were incomplete, although most of these were excluded for other reasons (for example they are Small non-acute hospitals).

Timeliness Accuracy

The reference period for this data set is 2013-14.

Almost all public hospitals provided data for the NHMD, with the exception of a Mothercraft hospital in the ACT.

States and territories are primarily responsible for the quality of the data they provide. However, the Institute undertakes extensive validation on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked with data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Cells have been suppressed to protect confidentiality (where the numerator would identify a single service provider).

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*.

The denominator for the indicator is based on the reported admitted patient activity, adjusted using cost-weights to derive a 'standard' unit of output as an artificial construct. The estimated number of cost-weighted separations (particularly using constant AR-DRGs and AR-DRG cost weights over time) is for comparison purposes only.

Comparisons of RSIs with earlier years should be undertaken with caution due to the use of different versions of AR-DRGs.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD and the NPHED. Published products available on the AIHW website include:

- Australian hospital statistics with associated Excel tables
- Interactive data cubes for Public hospital establishments.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AlHW website. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, changes in accounting methods and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Public hospital establishments and Admitted patient care are published in the AlHW's online metadata repository — METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- only cost weights applicable to acute care separations are available, so these have been applied to all separations, including the 3 per cent that were not acute.
- the proportion of patients other than public patients can vary, and the estimation of medical costs for these patients (undertaken to adjust expenditure to resemble what it would be if all patients had been public patients) is subject to error.
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Recurrent cost per non-admitted occasion of service

Data quality information for this indicator has been sourced from the Review with additional Steering Committee comments.

Indicator definition and description

Element

Efficiency

Indicator Measure Recurrent cost per non-admitted occasion of service

(computation

Recurrent cost per non-admitted occasion of service' is defined as the proportion of recurrent expenditure allocated to patients who were not admitted, divided by the total number of non-admitted patient occasions of service in public hospitals. Occasions of service include examinations, consultations, treatments or other services provided to patients in each functional unit of a hospital. Non-admitted occasions of service (including emergency department presentations and outpatient services) account for a

significant proportion of hospital expenditure.

Data source/s

This indicator is calculated using data from states and territories collected by the

Review.

Data Quality Framework Dimensions

Institutional environment

Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. States and territories use these data for service planning, monitoring and internal and

public reporting.

Relevance

This indicator does not adjust for the complexity of service — for example, a simple urine glucose test is treated equally with a complete biochemical analysis of all body fluids.

Timeliness

The reference period for this data set is 2013-14.

Accuracy

Inaccurate responses may occur in all data provided to the Review. The Review does not have direct access to records to determine the accuracy of the data provided. However, the Review undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The Review does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the Review. Processing errors prior to data supply may be found through the validation checks applied by the Review. This indicator is calculated on data that has been reported to the Review. Prior to publication, these data are referred back to jurisdictions for checking and review. The Review does not adjust the data to correct for missing values.

Coherence

Data are not available for two jurisdictions, Victoria and the NT.

These data are not comparable across jurisdictions. There is considerable variation among states and territories and between reporting years in the way in which non-admitted patient occasions of service data are collected.

- There are differing admission practices between the states and territories.
- There is variation in the types of services provided for non-admitted patients and the
 type of facility providing these services, for example, states and territories may differ
 in the extent to which outpatient services are provided in non-hospital settings (such
 as community health services).
- · Reporting categories vary across jurisdictions.
- Inconsistencies arising from differences in outsourcing practices. In some cases, for example, outsourced occasions of service can be included in expenditure on nonadmitted services, but not in the count of occasions of service.

Statistics on emergency department presentations for non-admitted patients may be affected by variations in reporting practices across states and territories. Although there are national standards for data on non-admitted patient emergency department services there are some variations in how those services are defined and counted across states and territories and over time. For example, there is variation in:

- the point at which the commencement of clinical care is reported
- the point at which the emergency department presentation is reported as completed for those patients subsequently admitted within the emergency department and/or elsewhere in the hospital.

For some jurisdictions, the reporting of outpatient clinic care varied over the periods 2010–11 and 2011–12, in order to align with the reporting requirements for Activity Based Funding. These changes included: the discontinuation of reporting for some activity; the commencement of reporting for some activity; and the re-categorisation of some clinics according to the Tier 2 clinics structure. Therefore, these data may not be comparable with data reported for previous years.

Accessibility

Cost per occasion of service data are not widely published elsewhere due to data quality issues. No nationally data collection currently exists which can produce comparable data. Data collection and reporting practices differ greatly across jurisdictions.

Interpretability

Supporting information on the quality and use of the data are not publicly available. Metadata such as concepts, classifications and counting rules are not published and are not consistent across jurisdictions.

Definitions are not well developed and could be ambiguous or confusing to the user.

There is little other information available to assist the user such as glossaries, standards, explanatory material, methodological information, user guides or classifications.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- the of recurrent expenditure that relates to occasions of service is estimated in different ways in different hospitals and is not always comparable
- This indicator does not adjust for the complexity of service, it is desirable for data to be casemix adjusted
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions
- Data are not available for two jurisdictions, Victoria and the NT.

Patient satisfaction

Data quality information for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element

Outcome

Indicator

Patient satisfaction

Measure (computation Measure: Nationally comparable information that indicates levels of patient satisfaction around key aspects of care they received.

- persons who had been to a hospital emergency department in the last 12 months reporting the doctors or specialists always or often: listened carefully, showed respect, and spent enough time with them
- persons who had been to a hospital emergency department in the last 12 months reporting the nurses always or often: listened carefully, showed respect, and spent enough time with them
- persons who had been admitted to a hospital in the last 12 months reporting the doctors or specialists always or often: listened carefully, showed respect, and spent enough time with them
- persons who have been admitted to a hospital in the last 12 months reporting the nurses always or often: listened carefully, showed respect, and spent enough time with them

Denominator:

- persons who had been to a hospital emergency department in the last 12 months, excluding persons who were interviewed by proxy
- persons who had been admitted to a hospital in the last 12 months, excluding persons who were interviewed by proxy

Data source/s

ABS Patient Experience Survey, 2014-15.

Data Quality Framework Dimensions

Institutional environment

Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment. Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975.

Data Compiler(s): Data is compiled by the Health section of the Australian Bureau of Statistics (ABS).

Statistical confidentiality is guaranteed under the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. The ABS notifies the public through a note on the website when an error in data has been identified. The data is withdrawn. and the publication is re-released with the correct data. Key users are also notified where possible.

Relevance

Level of Geography: Data is available by State/Territory, Sex, 2011 SEIFA (Index of Relative Socio-economic Disadvantage) and 2011 Remoteness (major cities, inner and outer regional, remote and very remote Australia).

Data Completeness: All data is available for this indicator from this source.

Numerator/Denominator Source: Same data source.

Data for this indicator was collected for all persons in Australia aged 15 years and over, excluding the following people:

- members of the Australian permanent defence forces
- diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts
- overseas residents in Australia
- members of non-Australian defence forces (and their dependents)
- people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons.
- People living in discrete indigenous communities

The 2011-12 iteration of the Patient Experience survey was the first to include households in very remote areas, (although it still excluded discrete indigenous communities). The 2014-15 iteration continues to include data from very remote areas. The inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the Northern Territory. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas.

Data was self-reported for this indicator. Persons who were interviewed by proxy were excluded.

Timeliness

Collection interval/s: Patient Experience data is collected annually.

Data available: The 2014-15 data used for this indicator became available from 13 November 2015.

Referenced Period: July 2014 to June 2015.

There are not likely to be revisions to this data after its release.

Accuracy

Method of Collection: The data was collected by computer assisted telephone interview

Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Sample/Collection size: The sample for the 2014-15 patient experience survey was 27 341 fully-responding persons.

Response rate: Response rate for the survey was 73 per cent

As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95 per cent confidence intervals. Estimates with a relative standard error between 25 per cent and 50 per cent should be used with caution, and estimates with a relative standard error over 50 per cent are considered too unreliable for general use.

This indicator generally has acceptable levels of sampling error and provides reliable data for most breakdowns. However, RSEs for the waiting time category "4 hours or more but within 24 hours" breakdowns are mostly greater than 25 per cent and should either be used with caution or are considered too unreliable for general use. Similarly, data for the "other" remoteness category has high RSEs when cross classified by State. Caution should be used when interpreting these data.

Known Issues: Data was self-reported and interpretation of urgent medical care was left up the respondent.

The data is self-reported but not attitudinal, as respondents are reporting their experiences of using the health system (in this instance, the time they waited between making an appointment for urgent medical care and the time they got to see the GP). Explanatory footnotes are provided for each table.

Confidentiality:

As in 2013-14, the 2014-15 data has been perturbed. This has been footnoted in the tables. Perturbation is used to minimise the risk of identifying individuals in aggregate statistics. Perturbation involves small random adjustment of the statistics and is

considered the most satisfactory technique for avoiding the release of identifiable statistics while maximising the range of information that can be released. These adjustments have a negligible impact on the underlying pattern of the statistics.

After perturbation, a given published cell value will be consistent across all tables. However, adding up cell values to derive a total will not necessarily give the same result as published totals.

Coherence

Consistency over time: 2009 was the first year data was collected for this indicator. Time series issues for unacceptable waiting times for GPs: Data for 2014-15 is comparable to 2013-14 and 2012-13, but not prior to this (ie not comparable to 2011-12 or 2010-11). While the question wording itself did not change, the position in the survey (ie where the question was asked) changed in 2011-12 and again in 2012-13. There has been a noticeable contextual effect with this change in question ordering, and ABS recommends that this data item is not comparable over time. This has been footnoted in the relevant tables.

Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other.

The numerator and denominator are compiled from a single source.

Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete indigenous communities in the sample will affect the NT more than it affects other jurisdictions.

Jurisdiction/Australia estimate calculation: All estimates are compiled the same way. Collections across populations: Data is collected the same way across all jurisdictions. The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources.

Due to differences in survey scope, collection methodology and question wording, these data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).

Accessibility

Data publicly available. Tables showing patients experiences with health professionals are available in; Health Services: Patient Experiences in Australia, 2009 (cat. no. 4839.0.55.001), Patient Experiences in Australia: Summary of Findings, 2010-11, Patient Experiences in Australia: Summary of Findings, 2011-12, Patient Experiences in Australia: Summary of Findings, 2012-13, Patient Experiences in Australia: Summary of Findings, 2013-14 and Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

Data for this indicator is shown by age, sex, SEIFA and remoteness. Jurisdictional data is not currently publicly available but may be made available in the future. Data is not available prior to public access.

Supplementary data is available. Additional data from the Patient Experience Survey is available upon request.

Access permission/Restrictions: Customised data requests may incur a charge. Contact Details: For more information, please call the ABS National Information and Referral Service on 1300 135 070.

Interpretability

Context: This data was collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data was collected over a twelve month period and therefore should minimise any seasonality effects in the data.

Other Supporting information: The ABS Patient Experience data is published in Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0). This publication includes explanatory and technical notes.

Socioeconomic status definition: The SEIFA Index of Relative Socio-economic Disadvantage uses a broad definition of relative socio-economic disadvantage in terms of people's access to material and social resources, and their ability to participate in society. While SEIFA represents an average of all people living in an area, it does not represent the individual situation of each person. Larger areas are more likely to have greater diversity of people and households.

Socioeconomic status derivation: The 2011 SEIFA index of relative socio-economic disadvantage is derived from Census variables related to disadvantage, such as low income, low educational attainment, unemployment, and dwellings without motor vehicles.

Socioeconomic status deciles derivation: Deciles are based on an equal number of areas. A score for a collection district (CD) is created by adding together the weighted characteristics of that CD. The scores for all CDs are then standardised to a distribution where the average equals 1000 and roughly two-thirds of the scores lie between 900 and 1100. The CDs are ranked in order of their score, from lowest to highest. Decile 1

contains the bottom 10 per cent of CDs, Decile 2 contains the next 10 per cent of CDs and so on. Further information on SEIFA can be found in the ABS Technical paper Socio-Economic Indexes for Areas 2011 (cat. No. 2033.0.55.001).

Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The Patient Experience Survey does not include people living in very remote areas, which affects the comparability of the NT results.
- State and Territory disaggregation of this indicator by Indigenous status and SES is a priority.
- Due to the requirement for sufficient data in specific age groups for the age standardisation process, remoteness disaggregation of age-standardised data by State and Territory is only available by major cities (with the other remoteness categories combined), with no State and Territory disaggregation available for SES.

Caesareans and inductions for selected primiparae

Data quality information for this indicator has been sourced from states and territories with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — appropriateness

Indicator Caesareans and inductions for selected primiparae

(computation

Measure Caesareans and inductions for selected primiparae' are defined as the number of

inductions or caesareans for the selected primiparae divided respectively by the number of the selected primiparae who gave birth.

Rates are reported for women aged between 20 and 34 years who have had no previous deliveries, with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks. This group is considered to be low risk parturients, so caesarean or induction rates

should be low in their population.

Primiparae refers to a woman who has given birth to a liveborn or stillborn infant for

the first time. Parturient means 'about to give birth'

Data source/s This indicator is calculated using data from states and territories.

Data Quality Framework Dimensions

Institutional environment Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

High intervention rates can indicate a need for investigation, although labour inductions and birth by caesarean section are interventions that are appropriate in some circumstances, depending on the health and wellbeing of mothers and babies.

Timeliness Accuracy

The reference period for the data is 2014. Collection of data is annual.

Inaccurate responses may occur in all data provided to the Review. The Review does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Review undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The Review does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the Review. Processing errors prior to data supply may be found through the validation checks applied by the Review. This indicator is calculated on data that has been reported to the Review. Prior to publication, these data are referred back to jurisdictions for checking and review. The Review does not adjust the data to correct for missing values.

Coherence

The age group of women used for this indicator has been changed from 25–29 years to 20–34 years in the 2015 Report to align with national data definitions. All time series data in attachment tables for the 2015 Report have been backcast by states and territories using the 20–34 year age group. However, data for this indicator are not comparable with data in previous report editions.

Note that because of data editing and subsequent updates of State/Territory databases, numbers reported for this indicator can differ from those in reports published by the states and territories.

Changing levels of Indigenous identification over time and across jurisdictions may also affect the accuracy of compiling a consistent time series in future years.

Accessibility

Data are published by states and territories and are also collected by the AIHW as part of the National Perinatal Data Collection. Note that the AIHW data are available to the Review one year later than that available to the Review by collecting data direct from states and territories.

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- · Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2001 to 2005. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data are collected direct from states and territories and are not reliable as they are
 not collected under a NMDS and have had minimal validation. The AlHW data,
 however, are less timely and are available to the Review one year later than that
 available to the Review by collecting data direct from states and territories.
- Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Instrument vaginal births

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness—appropriateness Indicator Instrument vaginal births

Measure 'Instrument vaginal births' is defined as the number of instrument vaginal births as a

(computation

percentage of total births. Instrument vaginal births includes forceps and vacuum extraction. The indicator is calculated for women aged 20 to 34 years, with a singleton baby positioned with head towards the cervix at the onset of labour born between 37 and 41 weeks gestation.

Data source/s

This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

Timeliness Accuracy

The reference period for the data is 2013. Collection of data for the NPDC is annual.

Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

Coherence

Data for this indicator are published in the AIHW National Perinatal Epidemiology and Statistics Unit report *National core maternity indicators*.

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- · Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- · National core maternity indicators
- METeOR online metadata repository
- · National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2006 to 2009. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and

their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Vaginal birth after caesarean section

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness—appropriateness
Indicator Vaginal birth after caesarean section

Measure (computation

'Vaginal delivery following a previous caesarean' is defined as the percentage of multiparous mothers who have had a previous caesarean, whose current method of birth was either an instrumental or non-instrumental vaginal delivery. Multiparous means a pregnant woman who had at least one previous pregnancy resulting in a live birth or stillbirth.

For multiple births, the method of birth of the first born baby was used.

Data source/s

This indicator is calculated using data from the AIHW National Perinatal Data

Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

Timeliness Accuracy

The reference period for the data is 2013. Collection of data for the NPDC is annual. Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

Coherence

Data for this indicator are published in the annual report Australia's mothers and habies

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2006 to 2009. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Interpretation of this indicator is ambiguous. There is ongoing debate about the relative risk to both mother and baby of a repeat caesarean section compared with a vaginal birth following a previous caesarean. Low rates of vaginal birth following a previous caesarean may warrant investigation, or on the other hand, they can indicate appropriate clinical caution. When interpreting this indicator, emphasis needs to be given to the potential for improvement.
- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- A formal assessment of the extent of under-identification of Indigenous status in the NPDC is required. This will identify whether the data require adjustment, and contribute to improved time series reporting.
- Disaggregation of this indicator for SES and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Perineal status after vaginal birth

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — quality/safety
Indicator Perineal status after vaginal birth

Measure 'Perineal status after vaginal birth' is the percentage of mothers with third or fourth

(computation degree lacerations to their perineum after a vaginal birth.

A 'third degree' laceration or rupture during birth (or a tear following episiotomy) involves the anal sphincter, rectovaginal septum and sphincter NOS. A 'fourth degree' laceration, rupture or tear also involves the anal mucosa and rectal mucosa.

For multiple births, the perineal status after birth of the first child was used.

Data source/s

This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

Timeliness Accuracy

The reference period for the data is 2013. Collection of data for the NPDC is annual.

Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

Coherence

Data for this indicator are published in the annual report Australia's mothers and babies.

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.
- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- A formal assessment of the extent of under-identification of Indigenous status in the NPDC is required. This will identify whether the data require adjustment, and contribute to improved time series reporting.
- Disaggregation of this indicator for SES and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Mother's average length of stay

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Mother's average length of stay

Measure (computation

'Mother's average length of stay' is defined as the total number of patient days for the selected maternity AR-DRG, divided by the number of separations for that AR-DRG. The AR-DRGs are:

- caesarean delivery without catastrophic or severe complications and comorbidities
- · vaginal delivery single uncomplicated.

Data source/s

This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with

respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness Accuracy

The reference period for this data set is 2013-14.

For 2012–13, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Australian hospital statistics* 2012–13.

The data can be meaningfully compared across all jurisdictions.

Due to changes in the classification between AR-DRG version 5.2, AR-DRG version 6.0 and AR-DRG version 6.0x, the data presented here are not comparable with the data presented in previous reports.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the National Hospital Morbidity Database can be

accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

Shorter stays for mothers reduce hospital costs but whether they represent genuine efficiency improvements depends on a number of factors. Shorter stays can, for example, have an adverse effect on the health of some mothers and result in additional costs for in-home care and potential readmissions. The indicator is not adjusted for multiple births born vaginally and without complications but requiring a longer stay to manage breastfeeding.

Apgar score at five minutes

Data quality information for this indicator has been sourced from states and territories with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Apgar score at five minutes

Measure This indicator is defined as the number of live births with an Apgar score of 3 or less,

(computation at five minutes post-delivery, as a proportion of the total number of live births by

specified birthweight categories.

The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability. Between 0 and 2 points are given for each of these five characteristics and the total score is between 0 and 10. The Apgar score is routinely assessed at one and five minutes after birth, and subsequently at five minute

intervals if it is still low at five minutes.

Data source/s This indicator is calculated using data from states and territories.

Data Quality Framework Dimensions

Institutional environment

Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance

The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

Timeliness Accuracy The reference period for the data is 2013. Collection of data is annual.

Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation

checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

The geographical location code for the area of usual residence of the mother is included in the Perinatal NMDS. Only 0.2 per cent of records were non-residents or could not be assigned to a state or territory of residence. There is no scope in the data element Area of usual residence of mother to discriminate temporary residence of mother for the purposes of accessing birthing services from usual residence. The former may differentially impact populations from remote and very remote areas, where services are not available locally.

Coherence

Data for this indicator are published in the annual report Australia's mothers and babies; and biennially in reports such as the Aboriginal and Torres Strait Islander Health Performance Framework report, the Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples, and the Overcoming Indigenous Disadvantage report. The numbers presented in these publications will differ slightly from those presented here as this measure excludes multiple births and stillbirths.

Changing levels of Indigenous identification over time and across jurisdictions may also affect the accuracy of compiling a consistent time series in future years.

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- · Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2001 to 2005. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Fetal, neonatal and perinatal deaths

Data quality information for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Fetal, neonatal and perinatal deaths

Measure Fetal deaths

(computation Nu

Numerator: Fetal deaths (stillbirth). The birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants weighing at least 400 grams or of a gestational age of at least 20 weeks.

Denominator: Total number of births (live births and fetal deaths combined).

Computation: The 'fetal death rate' is calculated as the number of fetal deaths divided by the total number of births expressed per 1000 total births, by State or Territory of usual residence of the mother.

Neonatal deaths

Numerator: Neonatal deaths. The death of a live born infant within 28 days of birth.

Denominator: The number of live births registered.

Computation: The 'neonatal death rate' is calculated as the number of neonatal deaths divided by the number of live births expressed per 1000 live births, by state or territory of usual residence of the mother

Perinatal death

Numerator: A perinatal death is a fetal or neonatal death.

Denominator: The total number of births (live births and fetal deaths combined).

Computation: The 'perinatal death rate' is calculated as the number of perinatal deaths divided by the total number of births expressed per 1000 total births, by State or Territory of usual residence of the mother.

Data source/s

ABS perinatal deaths are sourced from death registrations administered by the various state and territory Registrars of Births, Deaths and Marriages.

Data Quality Framework Dimensions

Institutional environment

ABS perinatal deaths are sourced from death registrations administered by the various state and territory Registrars of Births, Deaths and Marriages. It is a legal requirement of each state and territory that all neonatal deaths and those fetal deaths of at least 20 weeks gestation or 400 grams birth weight are registered. As part of the registration process, information on the cause of death is either supplied by the medical practitioner certifying the death on a Certificate of Cause of Perinatal Death, or supplied as a result of a coronial investigation.

Death records are provided electronically and/or in paper form to the ABS by individual Registrars on a monthly basis. Each death record contains both demographic data and medical information from the Certificate of Cause of Perinatal Death where available. Information from coronial investigations are provided to the ABS through the National Coroners Information System (NCIS).

For further information on the institutional environment of the Australian Bureau of Statistics (ABS), including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

Relevance

Perinatal statistics provide valuable information for the analysis of fetal, neonatal and perinatal deaths in Australia. This electronic product presents data at the national and state level on registered perinatal deaths by sex, state of usual residence, main condition in fetus/infant, main condition in mother and Indigenous status. Fetal, neonatal and perinatal death rates are also provided.

The ABS Perinatal Deaths collection includes all perinatal deaths that occurred and were registered in Australia, including deaths of persons whose usual residence is overseas. Deaths of Australian residents that occurred outside Australia may be registered by individual Registrars, but are not included in ABS deaths or perinatal deaths statistics.

From the 2006 reference year, the scope of the perinatal death statistics includes all fetal deaths of at least 20 weeks gestation or at least 400 grams birth weight, and all neonatal deaths (all live born babies who die within 28 days of birth, regardless of gestation or weight) which are:

- registered in Australia for the reference year and are received by the ABS by the end of the March quarter of the subsequent year; and
- registered prior to the reference year but not previously received from the Registrar nor included in any statistics reported for an earlier period.

Data for the 1999 to 2006 reference years based on the revised scope definition of at least 20 weeks gestation or at least 400 grams birth weight was republished in Perinatal Deaths, Australia, 2007(cat. no. 3304.0).

Data in the Perinatal Deaths collection include demographic items, as well as causes of death information, which is coded according to the International Classification of Diseases (ICD). ICD is the international standard classification for epidemiological purposes and is designed to promote international comparability in the collection, processing, classification, and presentation of cause of death statistics. The classification is used to classify diseases and causes of disease or injury as recorded on many types of medical records as well as death records. The ICD has been revised periodically to incorporate changes in the medical field. The 10th revision of ICD (ICD-10) is used for the 2009 data.

Timeliness

Perinatal deaths data are published annually and released approximately 15 months after the end of the reference period. Prior to the 2007 reference year, and from the 2010 reference year, ABS perinatal causes of death statistics are published in the annual Causes of Death, Australia (cat. no. 3303.0) collection.

Causes of death statistics are released with a view to ensuring that they are fit for purpose when released. To meet user requirements for timely data it is often necessary to obtain information from the administrative source before all information for the reference period is available (e.g. finalisation of coronial proceedings). A balance needs to be maintained between accuracy (completeness) of data and timeliness, taking account of the different needs of users. To address the issues which arise through the publication of causes of death data for open coroners cases, these data are now subject to a revisions process. This process enables the use of additional information relating to coroner certified deaths either 12 or 24 months after initial processing. See Explanatory Notes 28-32 for further information on the revisions process.

Accuracy

Non-sample errors are the main influence on accuracy in datasets such as this which are a complete census of the population rather than a sample. Non-sample error arises from inaccuracies in collecting, recording and processing the data. The most significant of these errors are: mis-reporting of data items; deficiencies in coverage; non-response to particular questions; and processing errors. Every effort is made to minimise non-sample error by working closely with data providers, running quality checks throughout the data processing cycle, training of processing staff, and efficient data processing.

The main sources of non-sample error for perinatal deaths data are:

- completeness of an individual record at a given point in time (e.g. incomplete causes of death information due to non-finalisation of coronial proceedings)
- completeness of the dataset e.g. impact of registration lags, processing lags and duplicate records
- extent of coverage of the population (whilst all deaths are legally required to be registered some cases may not be registered for an extended time, if at all)
- particular data items which would be useful for statistical purposes may not be collected by jurisdictions where that item is not essential for administration purposes
- question and 'interviewer' biases given that information for death registrations are supplied about the person by someone else. For example, Indigenous origin as reported by a third party can be different from self reported responses on a form
- level of specificity and completeness in coronial reports or doctor's findings on the Certificate of Cause of Perinatal Death will impact on the accuracy of coding

The ABS has implemented a new revisions process that applies to all coroner certified perinatal deaths registered after 1 January 2007. The revisions process enables the use of additional information relating to coroner certified perinatal deaths as it becomes available over time, resulting in increased specificity of the assigned ICD-10

codes. See Explanatory Notes 28-32 for further information on the revision process.

Coherence

Use of the supporting documentation released with the statistics is important for assessing coherence within the dataset and when comparing the statistics with data from other sources. Changing business rules over time and/or across data sources can affect consistency and hence interpretability of statistical output. The Explanatory Notes in each issue contains information pertinent to the particular release which may impact on comparison over time.

Accessibility

Prior to the 2007 reference year, and from the 2010 reference year, ABS perinatal causes of death statistics are published in Causes of Death, Australia (cat. no. 3303.0).

In addition to the information provided in the commentary, a series of data cubes are also available providing detailed breakdowns by cause of death. The ABS observes strict confidentiality protocols as required by the Census and Statistics Act (1905). This may restrict access to data at a very detailed level which is sought by some users

If the information you require is not available from the commentary or the data cubes, then the ABS may also have other relevant data available on request. Inquiries should be made to the National Information and Referral Service on 1300 135 070 or by sending an email to client.services@abs.gov.au.

Interpretability

Information on some aspects of statistical quality may be hard to obtain as information on the source data has not been kept over time. This is related to the issue of the administrative rather than statistical purpose of the collection of the source data.

Perinatal Deaths, Australia contains detailed Explanatory Notes, an Appendix and Glossary that provide information on the data sources, terminology, classifications and other technical aspects associated with these statistics.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

'Fetal death rate' is reported as an indicator because maternity services for admitted patients have some potential to reduce the likelihood of fetal deaths. However, this potential is limited and other factors (such as the health of mothers and the progress of pregnancy before hospital admission) are also important.

Hence, differences in the 'fetal death rate' between jurisdictions are likely to be due to factors outside the control of maternity services for admitted patients. To the extent that the health system influences fetal death rates, the health services that can have an influence include outpatient services, general practice services and maternity services.

As for fetal deaths, a range of factors contribute to neonatal deaths. However, the influence of maternity services for admitted patients is greater for neonatal deaths than for fetal deaths, through the management of labour and the care of sick and premature babies.

12 Mental health management

CONTENTS

| 12.1 Profile of mental health management | 12.2 |
|---|-------|
| 12.2 Framework of performance indicators | 12.11 |
| 12.3 Key performance indicator results | 12.14 |
| 12.4 Future directions in performance reporting | 12.53 |
| 12.5 Definitions of key terms | 12.53 |
| 12.6 List of attachment tables | 12.58 |
| 12.7 References | 12.62 |

Attachment tables

Attachment tables are identified in references throughout this chapter by a '12A' prefix (for example, table 12A.1). A full list of attachment tables is provided at the end of this chapter, and the attachment tables are available from the website at www.pc.gov.au/rogs/2016.

This chapter reports on the Australian, State and Territory governments' management of mental health and mental illnesses through a variety of service types and delivery settings. The chapter focuses on State and Territory governments' specialised mental health services and specific mental health services provided by General Practitioners (GPs), psychiatrists, psychologists and other allied health professionals under the Medicare Benefits Schedule (MBS).

Improvements to the reporting of mental health management in this edition include:

- additional data disaggregations for MBS subsidised services for the 'New client index' indicator
- new data on the duration of seclusion events reported as contextual information for the 'Rate of seclusion' indicator
- a new measure for the 'Social and economic inclusion of people with mental illness' indicator on the social participation of people with mental illness.

All abbreviations used in this Report are available in a complete list in volume A: Approach to performance reporting.

12.1 Profile of mental health management

Health management is the ongoing process beginning with initial client contact and including all actions relating to the client: assessment/evaluation; education of the person, family or carer(s); diagnosis; and treatment. Problems associated with adherence to treatment and liaison with, or referral to, other agencies are also included. Measuring performance in the management of a health problem involves measuring the performance of service providers in specific settings, and the overall management of diseases, illnesses and injuries across the spectrum of services, including prevention, early detection and treatment programs. The appropriate mix of services and of service delivery mechanisms is also important.

Mental health relates to an individual's ability to negotiate the daily challenges and social interactions of life without experiencing undue emotional or behavioural incapacity (DHAC and AIHW 1999). The World Health Organization describes positive mental health as:

... a state of well-being in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community (WHO 2001).

Mental health is identified by governments as one of the national health priority areas. The national health priority areas represent a large proportion of the total burden of disease and injury in Australia and mental illnesses makes a significant contribution to this total burden (Begg et al. 2007). The total burden comprises the number of 'years' lost due to fatal events (years of life lost due to premature death) and non-fatal events (years of 'healthy' life lost due to disability). Mental illness is the leading cause of 'healthy' life years lost due to disability (Begg et al. 2007).

Mental illness is a term that describes a diverse range of behavioural and psychological conditions. These conditions can affect an individual's mental health, functioning and quality of life. Each mental illness is unique in its incidence across the lifespan, causal factors and treatments. The most common mental illnesses are anxiety, affective (mood) and substance use disorders. Mental illness also includes low prevalence conditions such as schizophrenia, bipolar disorder and other psychoses, and severe personality disorder (DoHA 2010). While of lower prevalence, these conditions can severely affect people's ability to function in their daily lives (Morgan et al. 2011).

Mental health management is offered across a spectrum of government and non-government service providers that include promotion, prevention, treatment, management and rehabilitation services. Psychiatric hospitals, general hospitals with psychiatric units, community mental health facilities, psychiatrists, clinical psychologists, psychotherapists, mental health clinicians in private practice and counsellors all provide specialised mental health care. Mental health care is also provided in non-specialised settings — for example, GPs, public hospital emergency departments and outpatient departments, and public hospital general wards (as distinct from specialised psychiatric

units). Some people with a mental illness are cared for in residential aged care services. Mental health is also the subject of programs designed to improve public health.

This chapter focuses on the performance of State and Territory governments' specialised mental health services that treat the mostly low prevalence, but severe, mental illnesses and also on the specific mental health services provided by GPs, psychiatrists, psychologists and other allied health professionals under the MBS. It also reports on the interaction and integration arrangements between hospital and community-based services and on the broad social, economic and physical health outcomes of people with a mental illness.

Roles and responsibilities

National mental health policy context

In 1991, Australian Health Ministers signed the *Mental Health Statement of Rights and Responsibilities*. This Statement seeks to ensure that consumers, carers, advocates, service providers and the community are aware of their rights and responsibilities and can be confident in exercising them (Australian Health Ministers 1991). During 2011-12, the Statement was updated to align with the *National Mental Health Policy 2008* and Australia's international obligations with respect to the *United Nations Convention on the Rights of Persons with Disabilities and the United Nations Convention on the Rights of the Child*.

The Statement underpins the National Mental Health Strategy (NMHS) endorsed by Australian, State and Territory governments in 1992, but has been reaffirmed by health ministers a number of times since then (Department of Health 2014). The NMHS was established to guide the reform agenda for mental health in Australia across the whole of government. The NMHS consists of the National Mental Health Policy that describes its broad aims and objectives and the National Mental Health Plan that outlines the approach to implementing these aims and objectives. The National Mental Health Policy was revised in 2008 and the Fourth National Mental Health Plan was released in November 2009. The Fourth Plan (2009–2014) has now expired and a Fifth Plan is currently being developed.

Service roles and responsibilities

State and Territory governments are responsible for the funding, delivery and/or management of specialised mental health services including inpatient/admitted care in hospitals, community-based ambulatory care and community-based residential care. Some of these services are provided by non-government organisations (NGOs), for example governments can fund private entities to provide admitted patient hospital care. State and Territory governments also fund not-for-profit, NGOs to provide a range of support services for people with psychiatric disability arising from their mental illness.

The Australian Government is responsible for the oversight and funding of a range of mental health services and programs that are primarily provided or delivered by private practitioners or NGOs. These services and programs include MBS subsidised services provided by GPs (under both general and specific mental health items), private psychiatrists and allied mental health professionals, Pharmaceutical Benefits Scheme (PBS) funded mental health-related medications and other programs designed to prevent suicide or increase the level of social support and community-based care for people with a mental illness and their carers. The Australian Government also funds State and Territory governments for health services, most recently through the approaches specified in the National Health Reform Agreement (NHRA), but the mental health component of this funding is not separately identified for this Report.

Funding

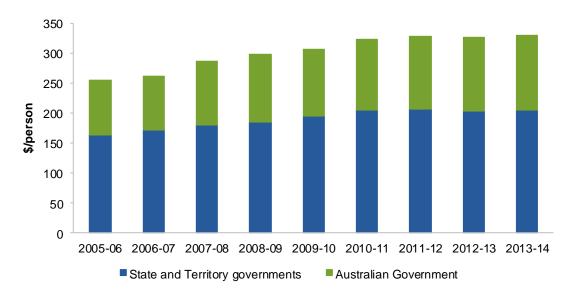

Real government recurrent expenditure of around \$7.7 billion was allocated to mental health services in 2013-14 (table 12A.4). State and Territory governments made the largest contribution (\$4.8 billion, or 62.4 per cent, which includes Australian Government funding under the NHRA), with Australian Government expenditure of \$2.9 billion or 37.6 per cent of total government recurrent expenditure on mental health services (table 12A.4).

Real recurrent government expenditure per person on mental health services increased from \$255.44 in 2005-06 to \$330.28 in 2013-14 (figure 12.1). The average annual growth rate for Australian Government real expenditure over this period was 5.7 per cent, which was slightly higher than the 4.7 per cent for State and Territory governments (table 12A.4).

Expenditure on MBS subsidised services was the largest component of Australian Government expenditure on mental health services in 2013-14 (\$971.0 million or 33.5 per cent) (table 12A.1). This comprised MBS payments for psychologists and other allied health professionals (15.0 per cent), consultant psychiatrists (11.1 per cent) and GP services (7.5 per cent) (table 12A.1). Another significant area of Australian Government expenditure on mental health services in 2013-14 was expenditure under the PBS for mental-health related medications (\$735.0 million) (table 12A.1).

Nationally, expenditure on admitted patient services is the largest component of State and Territory governments' expenditure on specialised mental health services (\$2.1 billion or 43.4 per cent in 2013-14), followed by expenditure on community-based ambulatory services (\$1.9 billion or 38.3 per cent) (figure 12.2). State and Territory governments' expenditure on specialised mental health services, by source of funds and depreciation (which is excluded from reporting) are in tables 12A.3 and 12A.5 respectively.

Size and scope of sector

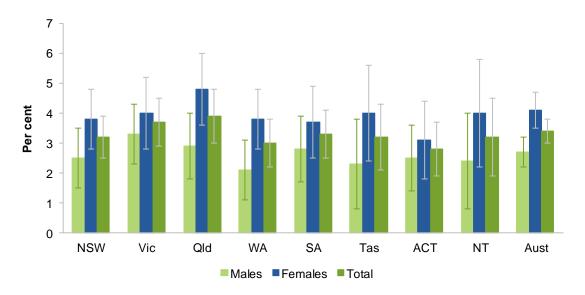

Prevalence of mental illness and psychological distress

According to the National Survey of Mental Health and Wellbeing (SMHWB), in 2007, 1 in 5 people aged 16–85 years (20.0 per cent, or approximately 3.2 million adults) met the criteria for diagnosis of a lifetime mental disorder/illness and had symptoms in the previous 12 months, and a further 25.5 per cent of people in this age group had experienced a mental disorder at some point in their life (table 12A.76).

A proxy measure of the overall mental health and wellbeing of the population is the Kessler 10 (K10) psychological distress scale. Very high levels of psychological distress may signify a need for professional help and provide an estimate of the need for mental health services (ABS 2012). Higher levels of psychological distress are reported for:

- females compared to males (figure 12.3)
- people with disability compared to those without (table 12A.9)
- people in lower socioeconomic areas compared to those in higher areas (table 12A.9)
- Aboriginal and Torres Strait Islander Australians compared to non-Indigenous Australians (table 12A.15).

Figure 12.3 Adults with very high levels of psychological distress, by gender, 2011-12^a

a See table 12A.8 for detailed footnotes and caveats.

Source: ABS (unpublished) Australian Health Survey (AHS) 2011–13 (2011-12 National Health Survey (NHS) component), Cat. no. 4364.0; table 12A.8.

There is also a strong association between a high/very high K10 score and a current diagnosis of anxiety and affective disorders, and people with a mental illness are overrepresented in the population who had high/very high levels of psychological distress (ABS 2012 and table 12A.7).

Tables 12A.8–16 contain additional data on high/very high levels of psychological distress.

Mental health services — overview

There are a range of Australian, State or Territory governments' provided or funded services that are specifically designed to meet the needs of people with mental health issues; the key services are:

- MBS subsidised mental health specific services that are partially or fully funded under Medicare on a fee for service basis and are provided by GPs, psychiatrists, psychologists or other allied health professionals under specific mental health items.
- Admitted patient care in public hospitals specialised services provided to inpatients in stand-alone psychiatric hospitals or psychiatric units in general acute hospitals.
- Community-based public mental health services, comprising:
 - ambulatory care services provided by outpatient clinics (hospital and clinic based),
 mobile assessment and treatment teams, day programs and other services dedicated
 to assessment, treatment, rehabilitation and care
 - residential services that provide beds in the community, staffed onsite by mental health professionals
- Not-for-profit, NGO services, funded by the Australian, State and Territory governments to provide community-based support for people with psychiatric disability, including accommodation, outreach to people living in their own homes, residential rehabilitation units, recreational programs, self-help and mutual support groups, carer respite services and system-wide advocacy (DoHA 2010).

There are also other health services provided and/or funded by governments that make a significant contribution to the mental health treatment of people with a mental illness, but are not specialised or specific mental health services. Tables 12A.30–32 provide information on these non-specialised services provided in hospitals.

MBS subsidised mental health services

GPs are often the first type of service accessed by people seeking help when suffering from a mental illness (AIHW 2014). GPs can diagnose, manage and treat mental illnesses and they also refer patients to more specialised service providers such as psychiatrists and psychologists.

In 2013-14, an estimated 12.8 per cent of GP encounters included management of mental health-related problems (equivalent to an estimated 17.1 million encounters) (table 12A.18). Data on GP mental-health related encounters by patient demographics are in table 12A.19.

A GP can manage more than one problem at a single encounter, hence the number of mental health problems can be greater than the number of mental-health related encounters. In 2013-14, 13.7 mental health-related problems were managed per 100 encounters (table 12A.20). Depression was the most frequently reported mental health-related problem managed (4.3 per 100 GP encounters), representing around one third of all mental health-related problems managed (table 12A.20).

In 2013-14, GPs provided 2.7 million MBS subsidised specific mental health items. A further 6.4 million MBS subsidised mental health services were provided by psychiatrists (2.2 million), psychologists (3.9 million) and allied health professionals (0.3 million) (table 12A.17). Service usage rates varied across states and territories (figure 12.4).

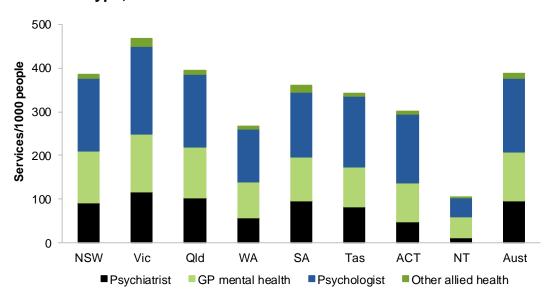

Figure 12.4 MBS subsidised mental-health related services, by provider type, 2013-14^a

Source: AIHW (2015) Mental Health Services in Australia (available at http://mhsa.aihw.gov.au/home/); table 12A.17.

State and Territory governments' specialised mental health services

State and Territory governments' specialised mental health services (covering the three service types of: admitted patient, community-based ambulatory and community-based residential) tend to treat people with the lower prevalence, but severe, mental illnesses. The

^a See table 12A.17 for detailed footnotes and caveats.

proportion of the total Australian population treated in these public services remained below 2 per cent between 2007-08 and 2013-14 (table 12A.42 and figure 12.5).

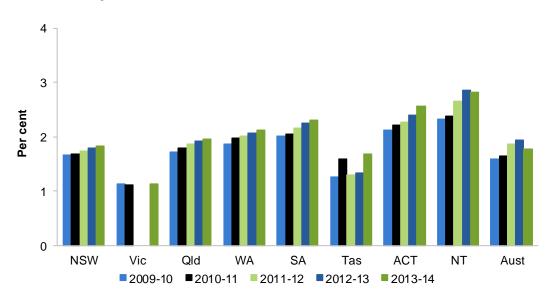

Figure 12.5 **Population using State and Territory governments'** specialised mental health services^{a, b}

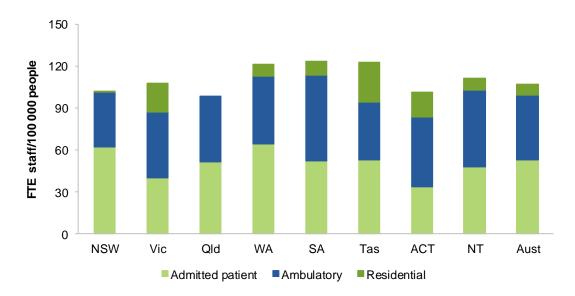

Source: AIHW (unpublished), derived from data provided by State and Territory governments; ABS (unpublished) Estimated Residential Population, 30 June (prior to relevant period); table 12A.42.

Across states and territories, the mix of admitted patient and community-based services and care types can differ. As the unit of activity varies across these three service types (table 12A.25), service mix differences can be partly understood by considering items which have comparable measurement across service types such as expenditure (figure 12.2), numbers of full time equivalent (FTE) direct care staff (figure 12.6), accrued mental health patient days (figure 12.7) and mental health beds (figure 12.8).

Additional data are also available on the most common principal diagnosis for admitted patients (tables 12A.22 and 12A.33) and community-based ambulatory contacts by age group (table 12A.24).

 $^{^{\}mathbf{a}}$ Victorian 2011-12 and 2012-13 data are not available. $^{\mathbf{b}}$ See table 12A.42 for detailed footnotes and caveats.

Government funded not-for-profit, NGO services

There are limited data available on the size and scope of the mental health services provided by the Australian, State and Territory governments' funded not-for-profit, NGO sector. The targeted community care (Mental Health) program is one exception. In 2013-14, there were 157 670 participants in the program across three service types: 18 539 for Personal Helpers and Mentors (PHaMs), 98 664 for Family Mental Health Support Services and 40 467 for Mental Health Respite: Carer Support (table 12A.29).

12.2 Framework of performance indicators

The framework of performance indicators for mental health services draws on governments' broad objectives as expressed in the *National Mental Health Policy 2008* (box 12.1).

Box 12.1 Broad objectives and policy directions of National Mental Health Policy

The *National Mental Health Policy 2008* has an emphasis on whole-of-government mental health reform and commits the Australian, State and Territory governments to the continual improvement of Australia's mental health system. The key broad objectives are to:

- promote the mental health and well-being of the Australian community and, where possible, prevent the development of mental health problems and mental illness
- reduce the impact of mental health problems and mental illness, including the effects of stigma on individuals, families and the community
- · promote recovery from mental health problems and mental illness
- assure the rights of people with mental health problems and mental illness, and enable them to participate meaningfully in society.

The key policy directions are summarised as follows:

- Rights and responsibilities of people with mental health problems and mental illness will be acknowledged and respected.
- Mental health promotion will support destigmatisation and assist people to be emotionally resilient, cope with negative experiences and participate in the community.
- The proportion of people with mental health problems, mental illness and people at risk of suicide will be reduced.
- Emerging mental health problems or mental illnesses will receive early intervention to minimise the severity and duration of the condition and to reduce its broader impacts.
- People will receive timely access to high quality, coordinated care appropriate to their conditions and circumstances.
- People with mental health problems and mental illness will enjoy full social, political and economic participation in their communities.
- The crucial role of carers will be acknowledged and respected and they will be provided with appropriate support to enable them to fulfil their role.
- The mental health workforce will be appropriately trained and adequate in size and distribution to meet the need for care.
- Across all sectors, mental health services should be monitored and evaluated to ensure they are of high quality and achieving positive outcomes.
- Research and evaluation efforts will generate new knowledge about mental health problems and mental illness that can reduce the impact of these conditions.

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of mental health management services (figure 12.9). It covers a number of service delivery types (MBS subsidised, admitted patient and community-based services) and includes outcome indicators of system-wide performance. The performance indicator framework shows which data are complete and comparable in the 2016 Report. Chapter 1 discusses data comparability from a Report-wide perspective (see chapter 1, section 1.6).

In addition to section 12.1, the Report's statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

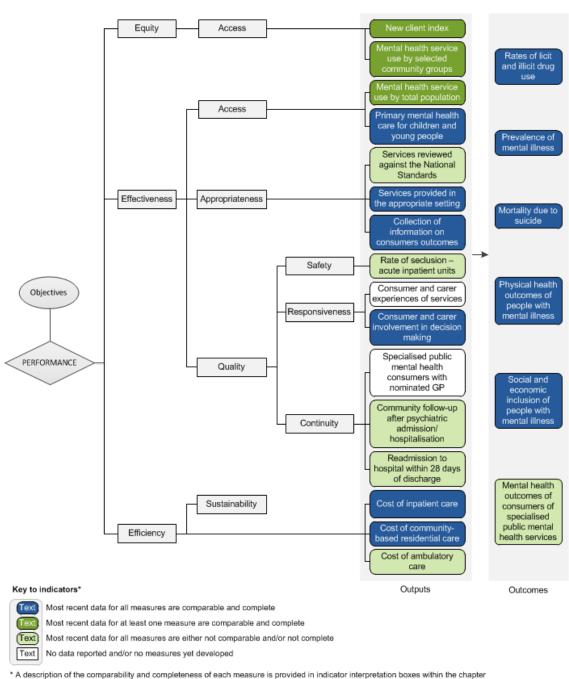

Figure 12.9 Mental health management performance indicator framework

12.3 Key performance indicator results

Different delivery contexts, locations and types of clients can affect the equity, effectiveness and efficiency of mental health management services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

Access — new client index

'New client index' is an indicator of governments' objective to provide mental health services in an equitable manner (box 12.2). Where population treatment rates are relatively low it may be difficult for a new client to access services if already used by existing clients.

Box 12.2 **New client index**

'New client index' is defined by two measures, the proportions of total clients under the care of:

- State and Territory governments' specialised public mental health services, who were new

 clients include all people who received one or more community-based ambulatory contact
 or had one or more day of admitted patient or community-based residential care.
- MBS subsidised mental health services provided by private psychiatrists, GPs and allied health providers, who were new.

A new client is a consumer who has not received a mental health service in the five years preceding the initial contact with a service in the relevant reference period.

(continued next page)

Box 12.2 (continued)

A high or increasing proportion of total clients who are new might be desirable, as it can suggest better access for new clients. However, results are difficult to interpret as the appropriate balance between providing ongoing care to existing clients who have continuing needs and meeting the needs of new clients is unknown. In addition, a significant increase in the proportion of new clients accessing services might be the result of an increase in the prevalence of mental illness.

This indicator does not provide information on whether the services are appropriate or adequate for the needs of the people receiving them (new or existing clients), or correctly targeted to those clients who are most in need.

Data reported for the proportions of total clients under the care of State and Territory governments' specialised public mental health services who were new are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data reported for the proportions of total clients under the care of MBS subsidised mental health services who were new are:

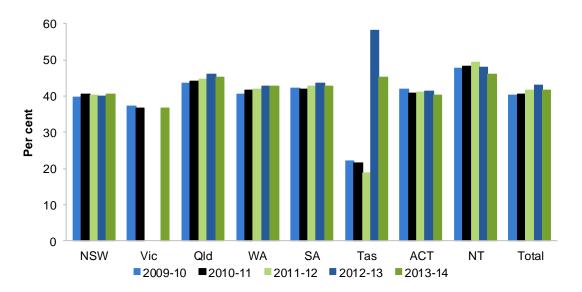

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally, the proportion of State and Territory governments' specialised mental health services clients who are new remained relatively stable over time (figure 12.10). These proportions tend to be higher than for clients of MBS subsidised mental health services nationally and for all jurisdictions, except the NT (figure 12.11).

For Aboriginal and Torres Strait Islander Australians, the proportion of clients who are new tend to be lower than for non-Indigenous Australians for State and Territory governments' specialised mental health services. By contrast, for MBS subsidised mental health services, the proportion of Aboriginal and Torres Strait Islander Australian clients who are new tends to be slightly higher than for non-Indigenous Australians (tables 12A.34 and 12A.36). Data are also reported by age, gender and remoteness in tables 12A.34 and 12A.36 and Socio-Economic Indexes for Areas (SEIFA) quintiles in table 12A.34.

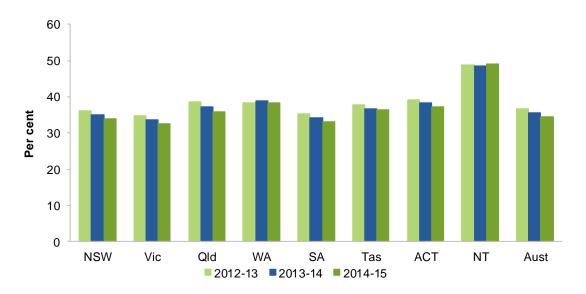

Figure 12.10 Proportion of State and Territory governments' specialised mental health service clients who are new^{a, b}

Access — mental health service use by selected community groups

'Mental health service use by selected community groups' is an indicator of governments' objective to provide mental health services in an equitable manner, including access to services by selected community groups such as Aboriginal and Torres Strait Islander Australians (box 12.3).

Box 12.3 Mental health service use by selected community groups

'Mental health service use by selected community groups' is defined by two measures:

- the proportion of the population in a selected community group using the service, compared to the proportion of the population outside the selected community group, for each of:
 - State and Territory governments' specialised public mental health services
 - MBS subsidised mental health services.

The selected community groups reported are Aboriginal and Torres Strait Islander Australians, people from outer regional, remote and very remote locations and people residing in low socioeconomic areas.

This indicator is difficult to interpret. Variations in use could be due to variations in access, but could also be a result of differences in the prevalence of mental illness. It also does not provide information on whether the services are appropriate for the needs of the people receiving them, or correctly targeted to those most in need.

Data reported for the State and Territory governments' specialised public mental health services measure:

- may not be comparable (subject to caveats) within jurisdictions over time and may not be comparable across jurisdictions (see caveats in DQI and attachment tables for details)
- are complete (subject to caveats) for the current reporting period (subject to caveats). All required 2013-14 data are available.

Data reported for the MBS subsidised mental health services measure are:

- comparable (subject to caveats) across jurisdictions but a break in series means that data from 2011-12 onwards by geographic location and SEIFA are not comparable to data for previous years' (see caveats in DQI and attachment tables for details)
- complete (subject to caveats) for the current reporting period (subject to caveats). All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

While a higher proportion of the population access MBS subsidised mental health services than State and Territory governments' specialised mental health services, the pattern of service use across the selected community groups differs.

For State and Territory governments specialised public mental health services, across all the selected community groups, higher proportions of people within these groups (Aboriginal and Torres Strait Islander Australians, people from outer regional, remote and very remote areas and people residing in low socioeconomic areas) access these services than those outside these groups (figures 12.12-13 and table 12A.39).

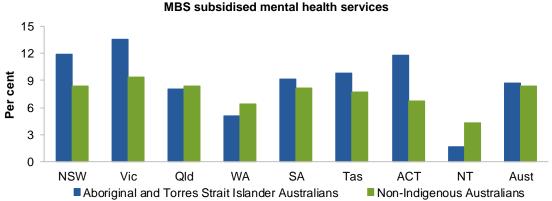

For MBS subsidised mental health services the results are mixed. Nationally, a similar proportion of Aboriginal and Torres Strait Islander Australians accessed these services to non-Indigenous Australians (figure 12.12), likewise for people across different socioeconomic areas (table 12A.39). Results varied across states and territories. However, for people in outer regional, remote and very remote areas, the proportions accessing MBS subsidised services were lower than for people in inner regional and major cities both nationally and across all states (figure 12.13).

Additional data on the use of State and Territory governments' specialised and MBS subsidised mental health services by community groups are in tables 12A.40–41. Data on the use of private hospital mental health services are also contained in tables 12A.37–39 and 12A.41–42.

Effectiveness

Access — mental health service use by total population

'Mental health service use by total population' is an indicator of governments' objective to provide equitable access to mental health services for all people who need them (box 12.4).

Box 12.4 Mental health service use by total population

'Mental health service use by total population' is defined as the proportion of the population using a State and Territory specialised public mental health service or a MBS subsidised mental health service. Data are reported separately for State and Territory specialised public mental health services and MBS subsidised mental health services.

This indicator is difficult to interpret. As a robust estimate of the population who need mental health services is not available, the indicator is reported as a proportion of the total population. Variations in use could be due to variations in access, but could also be a result of differences in the prevalence of mental illness.

This indicator does not provide information on whether the services are appropriate for the needs of the people receiving them, or correctly targeted to those most in need. People with a mental illness can have low rates of service use due to them choosing not to access services, appropriate services are unavailable, lack of awareness that services are available and negative experiences associated with the previous use of services (AHMC 2008). In addition, it might not be appropriate for all people with a mental illness to use a service, for example, some can seek and receive assistance from outside the health system (AHMC 2008).

Data reported for the State and Territory governments' specialised public mental health services measure are:

- comparable (subject to caveats) within most jurisdictions over time but are not comparable across jurisdictions or over time for Tasmania (see caveats in DQI and attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available.

Data reported for the MBS subsidised mental health services measure are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

In 2013-14, 1.8 per cent and 8.4 per cent of the total population received State and Territory governments' specialised mental health services and MBS subsidised services, respectively (figure 12.14). While the proportion of the population using State and Territory governments' specialised mental health services has remained relatively constant (figure 12.5), the proportion using MBS subsidised services has increased steadily over time from 4.9 per cent in 2007-08 to 8.4 per cent in 2013-14 (table 12A.42). Much of this growth has come from greater utilisation of GP mental health specific services (from 3.5 to 6.7 per cent) and other allied health services (1.3 per cent to 2.5 per cent) over that period (table 12A.42). Data from the 2007 SMHWB on the proportion of people with an mental illness who did/did not use services for their mental health are reported in table 12A.43.

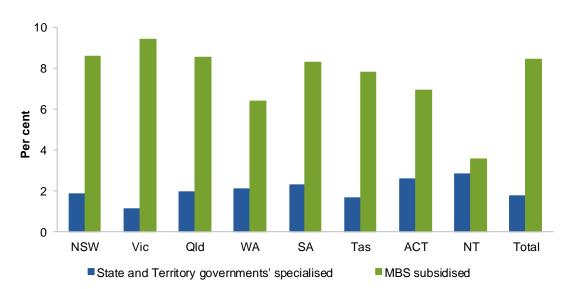

Figure 12.14 Population receiving mental health services, by service type, 2013-14^a

Source: AIHW (unpublished) derived from data provided by State and Territory governments and Australian Government, Department of Health and DVA; ABS (unpublished) *Estimated Residential Population*, 30 June (prior to relevant period); table 12A.42.

Data from the 2007 SMHWB on the proportion of people who had a lifetime mental disorder with symptoms in the 12 months before the survey who used any service for mental health are also reported in tables 12A.42–43.

Access — primary mental health care for children and young people

'Primary mental health care for children and young people' is an indicator of governments' objective to prevent, where possible, the development of mental health problems and mental illness and undertake early intervention for mental health problems and mental illness (box 12.5).

Box 12.5 Primary mental health care for children and young people

'Primary mental health care for children and young people' is defined as the proportion of young people aged under 25 years who received a mental health care service subsidised through the MBS from a GP, psychologist or an allied health professional.

High or increasing proportions of young people who had contact with MBS subsidised primary mental health care services is desirable.

(continued next page)

a See box 12.4 and table 12A.42 for detailed definitions, footnotes and caveats.

Box 12.5 (continued)

This indicator does not provide information on whether the services are appropriate for the needs of the young people receiving them, or correctly targeted to those young people most in need. Variations in use could be due to variations in access, but could also be a result of differences in the prevalence of mental illness.

Results for this indicator should be interpreted with caution as some primary mental health services for children and young people are excluded; for example, community health centres, school and university counsellors and health nurses and some mental health care provided by State and Territory governments' specialised mental health services (NMHPSC 2011a).

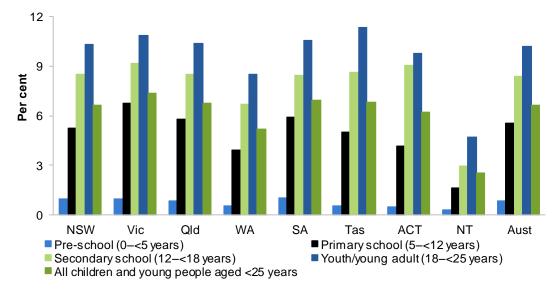

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The proportion of all children and young people who receive MBS subsidised primary mental health care services has increased gradually over time (table 12A.45). The proportion increases as age increases, with the highest proportion for young people aged 18–24 years (10.2 per cent of this population receiving these primary mental health care services nationally in 2014-15) (figure 12.15).

Figure 12.15 Children and young people who received MBS subsidised primary mental health care, by age group, 2014-15^a

 $^{{\}bf a}$ See table 12A.45 for detailed definitions, footnotes and caveats.

Source: Australian Government Department of Health (unpublished): table 12A.45.

Data on the proportion of young people who had received MBS subsidised primary mental health care services by Indigenous status, SEIFA, gender and service type are also available in tables 12A.46–47, with the pattern of results reflecting those for the total population (all ages).

Appropriateness — services reviewed against the National Standards

'Services reviewed against the National Standards' is an indicator of governments' objective to provide mental health services that are appropriate (box 12.6).

Box 12.6 Services reviewed against the National Standards

'Services reviewed against the National Standards' is defined as the proportion of expenditure on State and Territory governments' specialised public mental health services that had completed a review by an external accreditation agency against the National Standards for Mental Health Services (NSMHS) and were assessed at level 1. The assessment levels are defined as:

- Services at level 1 services reviewed by an external accreditation agency and judged to have met all National Standards.
- Services at level 2 services reviewed by an external accreditation agency and judged to have met some but not all National Standards.
- Services at level 3 services (i) in the process of being reviewed by an external accreditation agency but the outcomes are not known, or (ii) booked for review by an external accreditation agency.
- Services at level 4 services that do not meet criteria detailed under levels 1 to 3.

A high or increasing proportion of expenditure on specialised mental health services that had completed a review by an external accreditation agency and had been assessed against the NSMHS as level 1 is desirable.

This is a process indicator of appropriateness, reflecting progress made in meeting the NSMHS. It does not provide information on whether the standards or assessment process are appropriate. In addition, services that had not been assessed do not necessarily deliver services of lower quality. Some services that had not completed an external review included those that were undergoing a review and those that had booked for review and were engaged in self-assessment preparation.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The first NSMHS were developed under the *First National Mental Health Plan* 1993–1998 and revised NSMHS were released in September 2010 (box 12.7).

Box 12.7 The 2010 NSMHS

The 2010 NSMHS comprise 10 overarching standards:

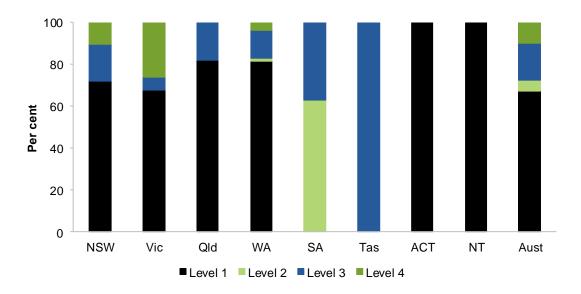

- 1. Rights and responsibilities
- 2. Safety
- 3. Consumer and carer participation
- 4. Diversity responsiveness
- 5. Promotion and prevention

- 6. Consumers
- 7. Carers
- 8. Governance, leadership and management
- 9. Integration
- 10. Delivery of care

Source: Australian Health Ministers' Conference (2010) National Standards for Mental Health Services 2010, Canberra.

Figure 12.16 shows the proportion of expenditure on specialised public mental health services that had completed an external review against the NSMHS and met 'all standards' (level 1).

Figure 12.16 Share of expenditure on specialised public mental health services reviewed against the NSMHS, by assessment level, 30 June 2014^a

^a See box 12.6 and table 12A.48 for detailed definitions, footnotes and caveats. *Source*: AIHW (unpublished) MHE NMDS; table 12A.48.

Appropriateness — services provided in the appropriate setting

'Services provided in the appropriate setting' is an indicator of governments' objective to provide mental health services in community-based settings wherever possible (box 12.8).

Box 12.8 Services provided in the appropriate setting

'Services provided in the appropriate setting' is defined as the proportion of State and Territory governments' recurrent expenditure on specialised public mental health services that was on community-based services. Community-based services expenditure comprises that on ambulatory care, adult residential services, and NGOs. Older people's residential expenditure is excluded to improve comparability.

A high or increasing proportion of recurrent expenditure spent on community-based services is desirable, reflecting a greater reliance on services that are based in community settings.

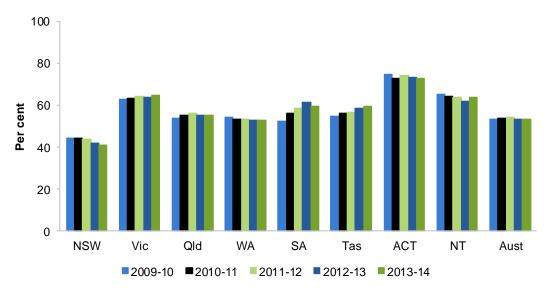

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

State and Territory governments' expenditure on community-based services as a proportion of total expenditure on specialised mental health services has remained stable over time (figure 12.17).

Figure 12.17 State and Territory governments' expenditure on community-based services as a proportion of total expenditure on specialised mental health services^a

a See box 12.8 and table 12A.49 for detailed definitions, footnotes and caveats. Source: AIHW (unpublished) MHE NMDS; table 12A.49.

Appropriateness — collection of information on consumers' outcomes

'Collection of information on consumers' outcomes' is an indicator of governments' objective that consumer outcomes be monitored (box 12.9).

Box 12.9 Collection of information on consumers' outcomes

'Collection of information on consumers' outcomes' is defined as the proportion of State and Territory governments' specialised public mental health service episodes (by client type) with completed clinical mental health outcome measures.

High or increasing proportions of episodes for which information on consumers' mental health outcomes is collected is desirable.

This is a process indicator and monitors the uptake of the routine National Outcomes Casemix Collection. It does not provide information on whether consumers had appropriate outcomes.

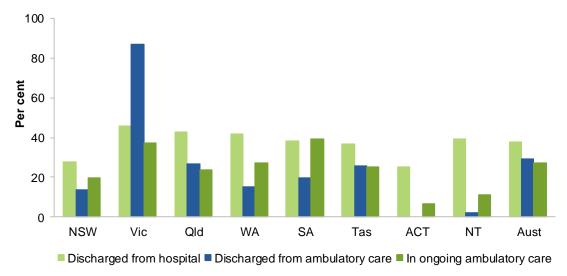

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required data for 2013-14 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The estimated proportions of specialised mental health service episodes for which 'complete' consumers' mental health outcomes are collected are shown in figure 12.18.

Figure 12.18 Estimated proportion of episodes for which 'complete' outcome measures were collected, by client type 2013-14a, b

a See box 12.9 and table 12A.50 for detailed definitions, footnotes and caveats. b ACT data for consumers discharged from ambulatory care are not published.

Source: AIHW (unpublished) from data provided by the Australian Mental Health Outcomes and Classification Network; table 12A.50.

Quality — safety — rate of seclusion — acute inpatient units

'Rate of seclusion — acute inpatient units' is an indicator of governments' objective that services are safe and of a high quality (box 12.10). The reduction, and where possible elimination of, seclusion in specialised mental health services is a national safety priority.

Box 12.10 Rate of seclusion — acute inpatient units

'Rate of seclusion — acute inpatient units' is defined as the number of seclusion events per 1000 bed days in State and Territory governments' specialised mental health acute inpatient units.

Seclusion involves a patient being confined at any time of the day or night alone in a room or area from which it is not within their control to leave (see section 12.5 for further details on seclusion and 'seclusion events'). Legislation or mandatory policy governs the use of seclusion in each State and Territory and may result in exceptions to the definition of a seclusion event and variations in the data collected across jurisdictions (NMHPSC 2011b).

(continued next page)

Box 12.10 (continued)

A low (or nil) or decreasing number of seclusion events per 1000 bed days in specialised public mental health inpatient units is desirable.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required data for 2014-15 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Supporting data on the duration of seclusion events are provided in table 12A.51. These data when considered with the rate of seclusion provide information on the use and management of seclusion within each jurisdiction. A low rate of seclusion events combined with shorter average durations is desirable.

Nationally, the number of seclusion events per 1000 bed days has decreased steadily from 11.8 in 2010-11 to 7.8 in 2014-15 (figure 12.19). This downward trend was reflected across most jurisdictions (figure 12.19) and target population groups (table 12A.52). The lowest seclusion rates were in older people's units and the highest were in children and adolescent units (table 12A.52).

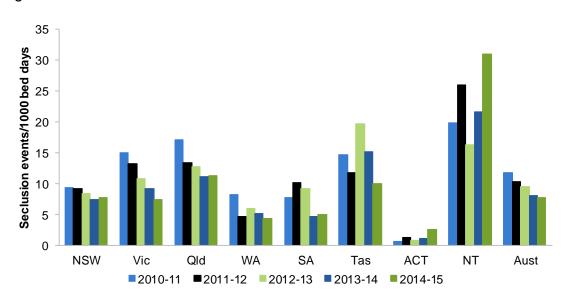

Figure 12.19 Rate of seclusion^a

Source: AIHW (2015) Mental Health Services in Australia Online, mhsa.aihw.gov.au/home/ (accessed 16 December 2015); table 12A.51.

^a See box 12.10 and table 12A.51 for detailed definitions, footnotes and caveats.

Quality — responsiveness — consumer and carer experiences of services

'Consumer and carer experiences of services' is an indicator of governments' objective that services are of a high quality and responsive to the needs of consumers and their carers (box 12.11).

Box 12.11 Consumer and carer experiences of services

'Consumer and carer experiences of services' is yet to be defined.

Data for this indicator were not available for the 2016 Report.

Quality — responsiveness — consumer and carer involvement in decision making

'Consumer and carer involvement in decision making' is an indicator of governments' objective that consumers and carers are involved at the service delivery level, where they have the opportunity to influence the services they receive (box 12.12).

Box 12.12 Consumer and carer involvement in decision making

'Consumer and carer involvement in decision making' is defined by two measures, the number of paid FTE:

- consumer staff per 1000 FTE direct care staff
- · carer staff per 1000 FTE direct care staff.

High or increasing proportions of paid FTE direct care staff who are consumers or carers implies better opportunities for consumers and carers to be involved at the service delivery level, where they can influence the services received.

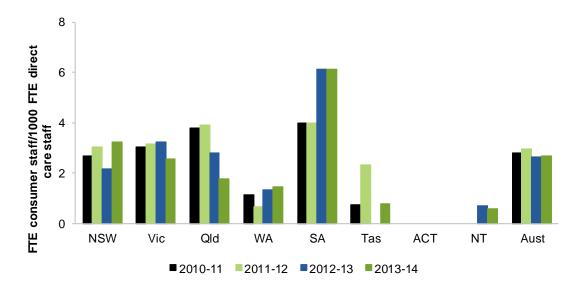

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions but a break in series means that data from 2010-11 are not comparable to data for previous years
- complete (subject to caveats) for the current reporting period. All required data for 2013-14 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The number of paid FTE consumer and carer staff per 1000 paid FTE direct care staff are reported in figures 12.20 and 12.21 respectively.

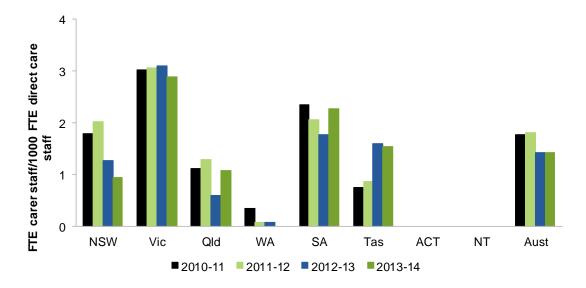

Figure 12.20 Paid FTE consumer staff per 1000 paid FTE direct care staff a, b, c, d

 $^{^{\}mathbf{a}}$ See box 12.12 and table 12A.53 for detailed definitions, footnotes and caveats. $^{\mathbf{b}}$ Tasmania did not employ consumer staff in 2012-13. $^{\mathbf{c}}$ The ACT do not employ consumer staff. $^{\mathbf{d}}$ The NT did not employ consumer staff in 2010-11 and 2011-12.

Source: AIHW (unpublished) MHE NMDS; table 12A.53.

Quality — continuity — specialised public mental health service consumers with nominated GP

'Specialised public mental health service consumers with nominated GP' is an indicator of governments' objective to provide continuity of care in the delivery of mental health services. GPs can be an important point of contact for those with a mental illness (box 12.13).

Box 12.13 Specialised public mental health service consumers with nominated GP

'Proportion of specialised public mental health service consumers with nominated GP' is yet to be defined.

Data for this indicator were not available for the 2016 Report.

Quality — continuity — community follow-up after psychiatric admission/hospitalisation

'Community follow-up after psychiatric admission/hospitalisation' is an indicator of governments' objective to provide continuity of care in the delivery of mental health services (box 12.14).

Box 12.14 Community follow-up after psychiatric admission/hospitalisation

'Community follow-up after psychiatric admission/hospitalisation' is defined as the proportion of State and Territory governments' specialised public admitted patient overnight acute separations from psychiatric units for which a community-based ambulatory contact was recorded in the seven days following separation.

A high or increasing rate of community follow-up within the first seven days of discharge from hospital is desirable.

This indicator does not measure the frequency of contacts recorded in the seven days following separation. It also does not distinguish qualitative differences between the mode of contact. Only follow-up contacts made by State and Territory governments' specialised public mental health services are included.

Data reported for this indicator are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in DQI and attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

For people who are discharged from hospital after an acute psychiatric episode, it is essential to have prompt community follow-up in the vulnerable period following discharge in order to maintain clinical and functional stability and minimise the need for hospital readmission (NMHPSC 2011a). Nationally, the rate of community follow-up for people within the first seven days of discharge from an acute inpatient psychiatric unit has increased from 49.6 per cent in 2009-10 to 66.4 in 2013-14 (figure 12.22). Community follow-up rates data by Indigenous status, remoteness areas, SEIFA, age groups and gender are in tables 12A.55–56.

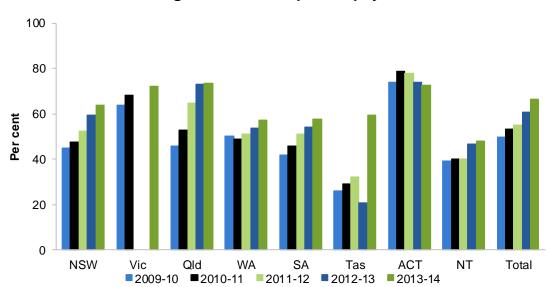

Figure 12.22 Community follow-up for people within the first seven days of discharge from acute inpatient psychiatric units^{a, b}

Source: AIHW (unpublished), from data provided by State and Territory governments; table 12A.54.

Quality — continuity — readmissions to hospital within 28 days of discharge

'Readmissions to hospital within 28 days of discharge' is an indicator of governments' objective to provide effective and continuous care in mental health services (box 12.15).

Box 12.15 Readmissions to hospital within 28 days of discharge

'Readmissions to hospital within 28 days of discharge' is defined as the proportion of State and Territory governments' admitted patient overnight separations from psychiatric acute inpatient units that were followed by readmission to a State and Territory governments' psychiatric acute inpatient unit within 28 days of discharge.

(continued next page)

 $^{^{\}mathbf{a}}$ See box 12.14 and table 12A.54 for detailed definitions, footnotes and caveats. $^{\mathbf{b}}$ Victorian data are not available for 2011-12 and 2012-13.

Box 12.15 (continued)

A low or decreasing rate of readmissions to hospital within 28 days of discharge is desirable. Readmissions following a recent discharge can indicate that inpatient treatment was either incomplete or ineffective, or that follow-up community care was inadequate to maintain people out of hospital (NMHPSC 2011a).

Readmission rates can be affected by factors other than deficiencies in specialised public mental health services, such as the cyclic and episodic nature of some illnesses (National Mental Health Working Group Information Strategy Committee Performance Indicator Drafting Group 2005).

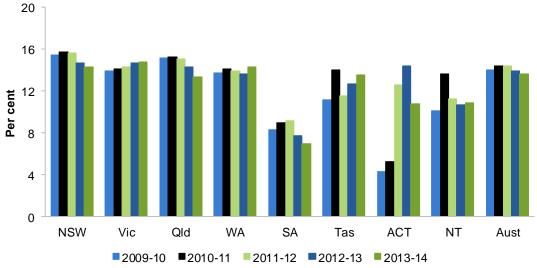

Data reported for this indicator are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in DQI or attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally, the rates of readmission to hospital acute psychiatric units within 28 days of discharge have remained relatively stable since 2009-10 (figure 12.23). Rates of readmission to hospital within 28 days of discharge by Indigenous status, remoteness areas, SEIFA, age group and sex are in table 12A.58.

^a See box 12.15 and table 12A.57 for detailed definitions, footnotes and caveats.
Source: AIHW (unpublished), from data provided by State and Territory governments; table 12A.57.

Efficiency

The efficiency indicators reported are for State and territory governments' specialised mental health services. Mainstreaming has occurred at different rates across states and territories, with some treating a greater proportion of clients with severe mental illnesses in community-based services than other jurisdictions. This can create differences across states and territories in the mix of clients, and therefore the costs, within service types.

Efficiency — Sustainability

The Steering Committee has identified sustainability as an area for reporting but no indicators have yet been identified.

Efficiency — cost of inpatient care

'Cost of inpatient care' is an indicator of governments' objective that mental health services are delivered in an efficient manner (box 12.16).

Box 12.16 Cost of inpatient care

'Cost of inpatient care' has two measures:

- 'Cost per inpatient bed day' is defined as expenditure on inpatient services divided by the number of inpatient bed days data are disaggregated by hospital type (psychiatric and general hospitals) and care type (acute and non-acute units) and by inpatient target population (acute units only).
- 'Average length of stay' is defined as the number of inpatient patient days divided by the number of separations in the reference period data are disaggregated by inpatient target population (acute units only). Patient days for clients who separated in the reference period (2013-14) that were during the previous period (2012-13) are excluded. Patient days for clients who remain in hospital (that is, are not included in the separations data) are included.

These measures are considered together for the inpatient acute units by target population to provide a 'proxy' measure to improve understanding of service efficiency. Average inpatient bed day costs can be reduced with longer lengths of stay because the costs of admission, discharge and more intensive treatment early in a stay are spread over more days of care.

A low or decreasing cost per inpatient bed day combined with similar or shorter average lengths of stay can indicate more efficient service delivery, although efficiency data need to be interpreted with care as they do not provide any information on the quality of service provided.

This indicator does not account for differences in the client mix. The client mix in inpatient settings can differ — for example, some jurisdictions treat a higher proportion of less complex patients in inpatient settings as distinct from treating them in the community. Measures that adjust to take into account the type and complexity of cases would be more appropriate but the data needed are not yet available.

(continued next page)

Box 12.16 (continued)

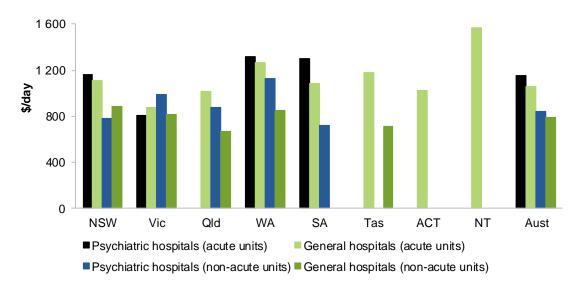

Data reported for the two measures for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions providing the services.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2013-14, the average cost per inpatient bed day was higher in acute than non-acute units and slightly higher in psychiatric hospitals than in general hospitals for both acute and non-acute units (figure 12.24).

Figure 12.24 Average recurrent cost per inpatient bed day, by public hospital and care type, 2013-14a, b, c, d

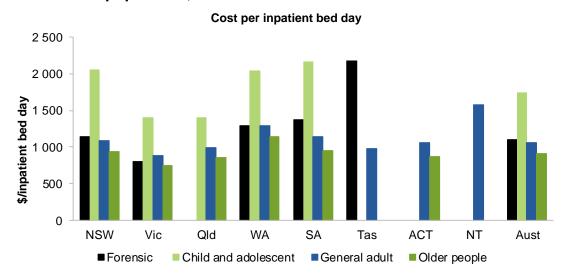

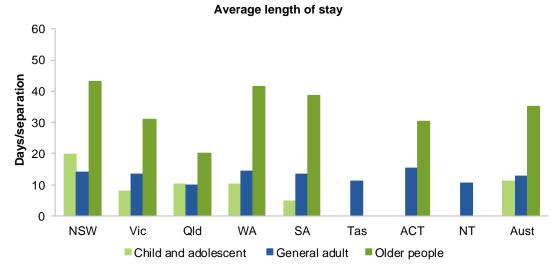

a See box 12.16 and table 12A.62 for detailed definitions, footnotes and caveats. b Queensland does not provide acute services in psychiatric hospitals. ^c Tasmania, the ACT and the NT do not have psychiatric hospitals. d SA, the ACT and the NT do not have non-acute units in general hospitals.

Source: AIHW (unpublished) MHE NMDS; table 12A.62.

Older people's units have lower costs per inpatient day, but have considerably longer lengths of stay than general adult or child and adolescent units (figure 12.25). Data for forensic services are included for costs per inpatient bed day only, as the length of stay is dependent on factors outside the control of these services. Data on the average cost per inpatient bed day by target population for all care types are reported in table 12A.59.

Figure 12.25 Inpatient care in acute units of public hospitals, by target population, 2013-14^{a, b, c, d, e}

^a See box 12.16 and tables 12A.60–61 for detailed definitions, footnotes and caveats. ^b Queensland does not report any acute forensic services. ^c Tasmania does not provide, or cannot separately identify, child and adolescent mental health services or older people's mental health services. ^d The ACT does not have separate forensic or child and adolescent mental health inpatient services. ^e The NT has general mental health services only.

Source: AIHW (unpublished) MHE NMDS; tables 12A.60-61.

Efficiency — cost of community-based residential care

'Cost of community-based residential care' is an indicator of governments' objective that specialised mental health services be delivered in an efficient manner (box 12.17).

Box 12.17 Cost of community-based residential care

'Cost of community-based residential care' is defined as the average cost per patient day. Data are reported for both the care of adults and older people.

A low or decreasing average cost per patient day can indicate efficiency, although efficiency data need to be interpreted with care as they do not provide any information on the quality of service provided.

The indicator does not account for differences in the client mix. The client mix in community-based services can differ across jurisdictions and can reflect differences in the rate of institutional change (that is, the mainstreaming of mental health services).

Data reported for this indicator are:

- · comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions providing the services.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2013-14, the average cost for 24 hour staffed residential care is higher for general adult units (\$535.58 per patient day) compared to older people's care units (\$397.86 per patient day), those this varied across states and territories (table 12A.63). Nationally and for all relevant jurisdictions, the costs for general adults units were higher for those staffed 24 hours compared to those that were non-24 hours staffed (table 12A.63).

Efficiency — cost of ambulatory care

'Cost of ambulatory care' is an indicator of governments' objective that specialised mental health services be delivered in an efficient manner (box 12.18).

Box 12.18 Cost of ambulatory care

'Cost of ambulatory care' is defined by two measures:

- · average cost per treatment day
- average number of treatment days per episode this measure is provided, along with average costs, as frequency of servicing is the main driver of variation in care costs.

An episode of ambulatory care is a three-month period of ambulatory care for an individual registered consumer where the consumer was under 'active care' (one or more treatment days in the period). Community-based periods relate to the following four fixed three-monthly periods: January to March, April to June, July to September, and October to December. Treatment day refers to any day on which one or more community contacts (direct or indirect) are recorded for a registered client during an ambulatory care episode.

(continued next page)

Box 12.18 (continued)

Low or decreasing average cost and/or fewer treatment days can indicate greater efficiency. Efficiency data need to be interpreted with care as they do not provide information on the quality of services provided.

The measures do not account for differences in the consumer mix. The consumer mix in community-based services can differ across jurisdictions and can reflect differences in the rate of institutional change (that is, the mainstreaming of mental health services) — for example, some State and Territory governments treat a higher proportion of consumers with more complex conditions in ambulatory care.

Data reported for the two measures are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required data for 2013-14 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally, the average recurrent cost per treatment day of ambulatory care declined slightly over the period 2009-10 to 2013-14 (figure 12.26), whereas the average treatment days per episode of ambulatory care increased slightly (figure 12.27).

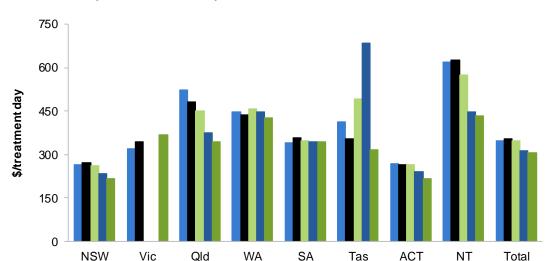

Figure 12.26 Average recurrent cost per treatment day of ambulatory care (2013-14 dollars)^{a, b}

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5). The outcome indicators identified and/or reported here reflect the performance of governments (including the mental health sector) against the broad objectives of the NMHS. The whole-of-government approach within the *Fourth National Mental Health Plan 2009–2014* acknowledges that many of the determinants of good mental health, and of mental illness, are influenced by factors beyond the health system.

Rates of licit and illicit drug use

'Rates of licit and illicit drug use' is an indicator of governments' objective to prevent the development of mental health problems and mental illness where possible, by reducing the prevalence of risk factors that contribute to the onset of mental illness and prevent longer term recovery (box 12.19).

Box 12.19 Rates of licit and illicit drug use

'Rates of licit and illicit drug use' is defined as the proportion of people aged 14 years or over who used alcohol at 'risky' levels and illicit drugs in the preceding 12 months. 'Risky' alcohol use is defined as more than two standard drinks per day on average. The specific illicit drugs include: cannabis, ecstasy, cocaine, meth/amphetamine, hallucinogens, Gamma hydroxybutyrate (GHB), inhalants, and heroin.

A low or decreasing proportion of people using alcohol at risky levels or using illicit drugs is desirable.

Many of the risk and protective factors that affect a person's propensity to consume these drugs lie outside the control of the mental health system. These include environmental, sociocultural and economic factors.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions but a break in series means that data for 2013 and 2010 are not comparable to data for earlier years
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

In 2013, 18.2 per cent of people aged 14 years or over drank alcohol at levels considered 'risky' for developing long-term health problems (figure 12.28).

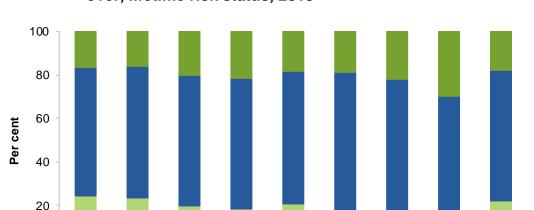

Figure 12.28 Use of alcohol in last 12 months by people aged 14 years or over, lifetime risk status, 2013^a

0

NSW

Vic

^a See box 12.19 and table 12A.65 for detailed definitions, footnotes and caveats.

The proportion of people who drank at these 'risky' levels slightly decreased between 2007 and 2013, a trend that was consistent across both males and females and most age groups (table 12A.71). Further data on alcohol use, and lifetime and single occasion risk status for 2013, 2010 and 2007, and by Indigenous status and remoteness areas are in tables 12A.66 and 12A.69-72.

Cannabis, ecstasy, cocaine and meth/amphetamines are the most widely used illicit drugs in Australia (table 12A.67). Data across the 2007, 2010 and 2013 surveys show that people using illicit drugs had higher levels of psychological distress and a higher proportion of people with a mental illness used illicit drugs than those without a mental illness (table 12A.74). Data by Indigenous status and remoteness areas are in table 12A.75.

Younger people's use of cannabis and meth/amphetamines is of particular concern. Cannabis can precipitate schizophrenia in people who have a family history, increase the risk of psychosis symptoms and also exacerbate the schizophrenia symptoms (AHMC 2012). Psychosis symptoms are also associated with meth/amphetamine use and dependent meth/amphetamine users can also suffer from a range of co-morbid mental health problems (AHMC 2012). Since 2001, the proportions of younger people aged 14–19 years and 20–29 years who used these drugs decreased (figure 12.29). Cannabis use in 2013 by state and territory and age group are reported in table 12A.68.

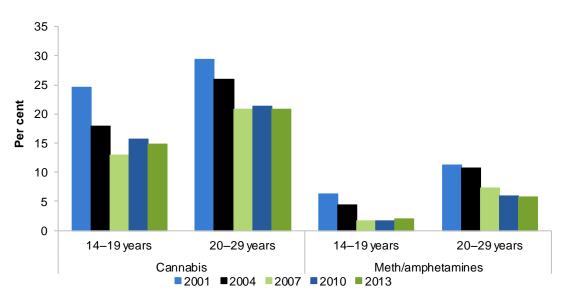

Figure 12.29 Young people's use of cannabis and meth/amphetamines, by age groupa

Source: AIHW (2014) National Drug Strategy Household Survey detailed report 2013, Drug statistics series no. 28, Cat. no. PHE 183, Canberra; table 12A.73.

a See box 12.19 and table 12A.73 for detailed definitions, footnotes and caveats.

Prevalence of mental illness

'Prevalence of mental illness' is an indicator of governments' objective to prevent the development of mental health problems and mental illness where possible (box 12.20).

Box 12.20 Prevalence of mental illness

'Prevalence of mental illness' is defined as the proportion of the total population who have a mental illness. Proportions are reported for all people by sex, age group and disorder type.

A low or decreasing prevalence of mental illness can indicate that measures to prevent mental illness have been effective.

A reduction in the prevalence of mental illness can be brought about by preventative activities to stop an illness occurring, or by increasing access to effective treatments for those who have an illness (AHMC 2012). Many of the risk and protective factors that can affect the development of mental health problems and mental illness are outside the scope of the mental health system, in sectors that affect the daily lives of individuals and communities. These include environmental, sociocultural and economic factors, of which some can increase the risk of mental illness whilst others can support good mental health.

Not all mental illnesses are preventable and a reduction in the effect of symptoms and an improved quality of life will be a positive outcome for many people with a mental illness.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions (no time series data are reported)
- complete (subject to caveats) for the current reporting period. All required 2007 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2007, the prevalence of a mental illness (with symptoms in the previous 12 months) was 20.0 per cent for people aged 16–85 years, with a further 25.5 per cent reported as having a mental illness at some point in their life (no symptoms in the last 12 months) (table 12A.76). National data on the prevalence of mental illness by disorder, age, sex and social characteristics are reported in tables 12A.76–78. These prevalence estimates are for the mental disorders that are considered to have the highest incidence rates in the population, but not some severe mental disorders, such as schizophrenia and bipolar disorder. The *National Survey of Psychotic Illness 2010* provides information on the one month treated prevalence of psychotic illnesses. In 2010, there were an estimated 3.1 cases of psychotic illness per 1000 adult population (aged 18–64 years) (Morgan et al. 2011).

The prevalence of mental illness among children and young people aged 4–17 years was an estimated 13.9 per cent in 2013-14 (Lawrence et al. 2015). Attention deficit/hyperactivity disorder (ADHD) was the most common mental illness overall for this age group, with 7.4 per cent assessed as having ADHD in the previous 12 months, followed by anxiety disorders (6.9 per cent) (Lawrence et al. 2015).

Mortality due to suicide

'Mortality due to suicide' is an indicator of governments' objective to prevent mental health problems, mental illness and suicide, and identify and intervene early with people at risk (box 12.21).

Box 12.21 Mortality due to suicide

'Mortality due to suicide' is defined as the suicide rate per 100 000 people. The suicide rate is reported for all people by sex, age group, Indigenous status and significant urban areas. Deaths from suicide are defined as causes of death with the International Classification of Diseases (ICD)-10 codes X60–X84 and Y87.0.

A low or decreasing suicide rate per 100 000 people is desirable.

While mental health services contribute to reducing suicides, other government services also have a significant role. Public mental health programs are primarily concerned with providing treatment and support services for individual clients affected by severe mental illness, some of whom have either attempted, or indicated an intention, to commit suicide. Suicide prevention targeted at the wider population is also addressed through the initiatives of other government agencies, NGOs and other special interest groups.

Many factors outside the control of mental health services can influence a person's decision to commit suicide. These include environmental, sociocultural and economic risk factors. Often a combination of these factors can increase the risk of suicidal behaviour.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time for some years and disaggregations but not comparable for other years and disaggregations (see the DQI and attachment tables 12A.82–84 for details)
- complete (subject to caveats) for the current reporting period. All required 2013 or 2009–2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

People with a mental illness are at a higher risk of suicide than are the general population. For the period 2009–2013, 12 306 deaths by suicide were recorded in Australia (table 12A.81) — equivalent to 10.9 deaths per 100 000 people (figure 12.30). Nationally, the suicide rate increased as remoteness increased (ranging from 9.6 suicides per 100 000 people in capital cities to 14.8 suicides per 100 000 people in rural areas), with a similar pattern in most states and territories (table 12A.84).

Suicide data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT only (figure 12.31). For the period 2009–2013, after adjusting for differences in population age structures, the rate of deaths for Aboriginal and Torres Strait Islander Australians due to suicide was almost twice the rate for non-Indigenous Australians (figure 12.31).

20 - | 15 - | 10 000 beoble | 15 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - | 10 - |

^a See box 12.21 and table 12A.85 for detailed definitions, footnotes and caveats. Source: ABS (unpublished) Causes of Deaths, Australia, Cat. no. 3303.0; table 12A.85.

relatively constant over all age groups, except for those aged 85 years or over where the male suicide rate was around six times the female rate (table 12A.81).

Historical data are available by sex in table 12A.80 and by state and territory in tables 12A.82–84.

Physical health outcomes for people with a mental illness

'Physical health outcomes for people with a mental illness' is an indicator of governments' objective to promote the recovery of people with a mental illness and to provide high quality co-ordinated services that are appropriate to the conditions and circumstances of people with a mental illness (box 12.22).

Box 12.22 Physical health outcomes for people with a mental illness

'Physical health outcomes for people with a mental illness' is defined by two measures, the proportion of adults with a mental illness (compared with the proportion of adults without a mental illness):

- who are exposed to particular health risk factors: obese/overweight, daily smokers and at risk of long term harm from alcohol.
- who experienced a long-term physical health condition: cancer, diabetes, arthritis, cardiovascular disease and asthma.

Low or decreasing proportions of people with a mental illness who are subject to particular health risk factors and who experience a long-term physical health condition are desirable.

People with a mental illness have worse physical health outcomes than people without mental illness (Coghlan et al. 2001; Happell et al. 2015; Joukamaa et al. 2001; Sartorius 2007; Lawrence, Hancock and Kisely 2013). However, the relationship between a physical and mental health is complex. Poor physical health can exacerbate mental health problems and poor mental health can lead to poor physical health. In addition, some psychiatric medications that are prescribed to treat mental health conditions are known to lead to worse physical health outcomes.

Data for these measures include 95 per cent confidence intervals (in the form of error bars in figures).

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions (no time series data are reported)
- complete (subject to caveats) for the current reporting period. All required 2011-12 data are available for all jurisdictions.

The total and non-Indigenous components of the 2011-13 AHS does not include people living in discrete Aboriginal and Torres Strait Islander communities and very remote areas, which affects the comparability of the NT results.

Data quality information for this indicator is under development.

Greater exposure to particular health risk factors can contribute to poorer physical health. In 2011-12, people with a mental illness had significantly higher daily smoking rates (26.1 per cent) compared to people without a mental illness (14.7 per cent) (figure 12.32). The proportions of people who are obese/overweight or at risk of long term harm from alcohol are similar for those with and without a mental illness (table 12A.86).

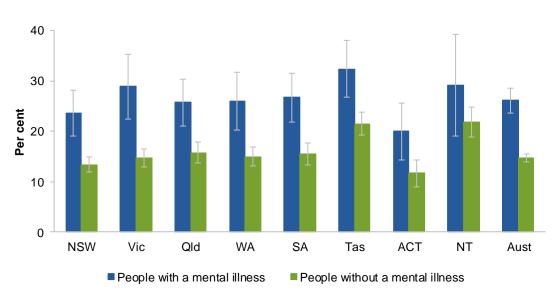

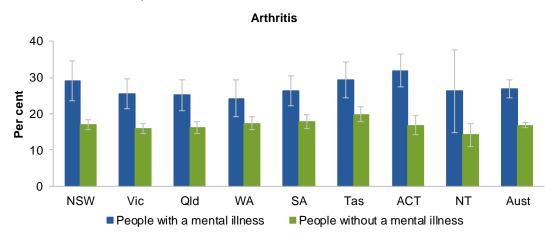

Figure 12.32 Adults who are daily smokers, by mental illness status, 2011-12^a

A higher proportion of people with a mental illness had long-term health conditions compared to people without mental illness. Nationally in 2011-12, the proportions of people with a mental illness who had arthritis (26.9 per cent) and cardiovascular disease (9.5 per cent) were higher than those without mental illness (16.7 per cent and 5.2 per cent respectively) (figure 12.33). Table 12A.87 provides data for cancer, asthma and diabetes.

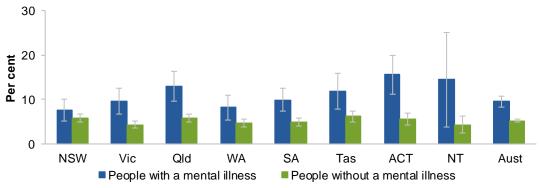

^a See box 12.22 and table 12A.86 for detailed definitions, footnotes and caveats.

Social and economic inclusion of people with a mental illness

'Social and economic inclusion of people with a mental illness' is an indicator of governments' objective to improve mental health and facilitate recovery from illness through encouraging meaningful participation in recreational, social, employment and other activities in the community (box 12.23).

Box 12.23 Social and economic inclusion of people with a mental illness

'Social and economic inclusion of people with a mental illness' is defined by three measures, the proportion of people:

- aged 16–64 years with a mental illness who are employed, compared with the proportion for people without a mental illness
- aged 16–30 years with a mental illness who are employed and/or are enrolled for study in a formal secondary or tertiary qualification (studying full or part time), compared with the proportion for people without a mental illness
- aged 15 years or over with a mental illness who had face-to-face contact with family or friends living outside the household in the last week, compared with the proportion for people without a mental illness.

High or increasing proportions for people with a mental illness, and proportions that are similar to those without a mental illness, of people who are employed, who had face-to-face contact with family or friends and who are employed and/or are enrolled for study are desirable.

This indicator measures employment participation relative to the total population, as distinct from the labour force. Some people can choose not to participate in the labour force (that is, they are not working or actively looking for work). It also does not provide information on whether the employment, education or social activities participated in were appropriate or meaningful.

Data for these measures include 95 per cent confidence intervals (in the form of error bars in figures).

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions for all surveys and over time for the 2011-12 and 2007-08 NHS data
- complete (subject to caveats) for the current reporting period. All required 2011-12 data and 2014 data are available for all jurisdictions.

The total and non-Indigenous components of the 2011-13 AHS and the 2014 General Social Survey does not include people living in discrete Aboriginal and Torres Strait Islander communities and very remote areas, which affects the comparability of the NT results.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

While employment is recognised as important in supporting good mental health, having a mental illness can act as a barrier to gaining and maintaining employment (AHMC 2012). Nationally in 2011-12, the proportion of people employed was lower for those with a mental illness (61.7 per cent) compared to those without a mental illness (80.3 per cent) (figure 12.34). The significantly higher proportion of people with a mental illness who do not participate in the labour force, compared to those without a mental illness, is a major contributing factor (32.0 per cent compared to 16.7 per cent). Historical data are available in tables 12A.90, 12A.92 and 12A.94.

Mental illness in early adult years can lead to disrupted and premature exit from education or disrupt the transition from school to work. These disruptions can have long term effects

on the person's ability to participate in a range of vocational activities (AHMC 2012). Nationally in 2011-12, the proportion of people aged 16–30 years with a mental illness who were employed and/or are enrolled for study in a formal secondary or tertiary qualification was 79.2 per cent, compared to 90.2 per cent for those without a mental illness (table 12A.89). Historical data are available in tables 12A.91 and 12A.93–94.

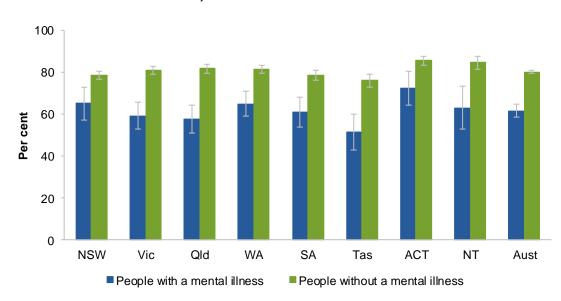

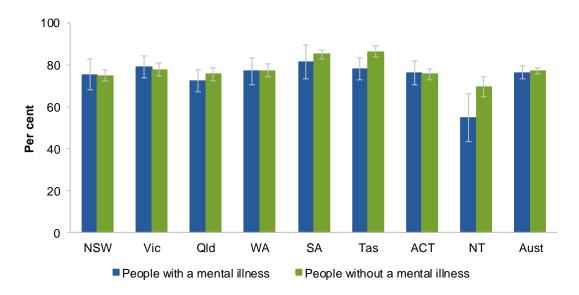

Figure 12.34 People aged 16–64 years who are employed, by mental illness status, 2011-12^a

Contact with immediate household, extended family, friends, and neighbours is related to lower levels of psychological distress and therefore can protect against the onset and adverse course of mental illnesses (Berry et al. 2007). Nationally in 2014, the proportion of people aged 15 years or over with a mental illness who had face-to-face contact with family or friends living outside the household in the last week (76.5 per cent) was similar to the proportion for people without a mental illness (77.1 per cent) (figure 12.35).

^a See box 12.23 and table 12A.88 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) AHS 2011–13 (2011-12 NHS component), Cat. no. 4364.0; table 12A.88.

Mental health outcomes of consumers of specialised public mental health services

'Mental health outcomes of consumers of specialised public mental health services' is an indicator of governments' objective to improve the effectiveness and quality of service delivery and outcomes and promote recovery from mental health problems and mental illness (box 12.24).

Box 12.24 Mental health outcomes of consumers of specialised public mental health services

'Mental health outcomes of consumers of specialised public mental health services' is defined as the proportion of people receiving care who had a significant improvement in their clinical mental health outcomes. See section 12.5 for information on how the consumer outcomes average score is derived. Data are also reported on the proportion who experienced no significant change or a significant deterioration in their mental health outcomes. Data are reported by three consumer types: people in ongoing community-based ambulatory care, people discharged from community-based ambulatory care and people discharged from a hospital psychiatric unit.

(continued next page)

Box 12.24 (continued)

A high or increasing proportion of people receiving care in State and Territory governments' specialised public mental health services who had a significant improvement in their clinical mental health outcomes is desirable.

This indicator has a number of technical and conceptual issues. The outcome measurement tool is imprecise. A single 'average score' does not reflect the complex service system in which services are delivered across multiple settings (inpatient, ambulatory and residential) and provided as both discrete, short term episodes of care and prolonged care over indefinite periods (AHMC 2012). The approach separates a consumer's care into segments (hospital versus the community) rather than tracking the person's overall outcomes across treatment settings. In addition, consumers' outcomes are measured from the clinician's perspective and not as the 'lived experience' from the consumer's viewpoint (AHMC 2012).

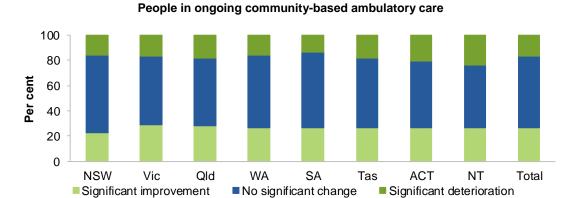

Data reported for this indicator:

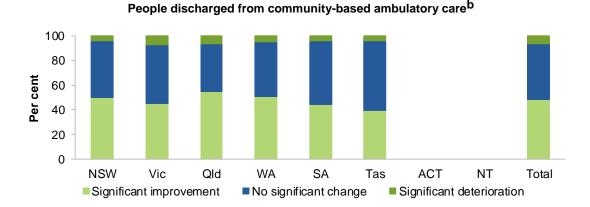

- may not be comparable (subject to caveats) within jurisdictions over time and may not be comparable across jurisdictions due to differences in the quality of the data and the proportion of episodes for which completed outcomes data are available
- are complete (subject to caveats) for the current reporting period. All required data for 2013-14 are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Nationally in 2013-14, 26.6 per cent of people in ongoing ambulatory care, 48.4 per cent of people discharged from ambulatory care and 72.4 per cent of people discharged from a hospital psychiatric inpatient unit showed a significant improvement in their mental health clinical outcomes (figure 12.36). Across age groups and over the reporting years from 2007-08, for those discharged from hospital and community care, a larger proportion of people aged 18–64 years old showed a significant improvement compared to those in other age groups. Whereas, for those in ongoing community care, younger people aged 0–17 years had the highest proportion who showed a significant improvement compared to other age groups (table 12A.97).

Figure 12.36 Mental health outcomes of consumers of State and Territory governments' specialised mental health services, 2013-14^a

a See box 12.24 and table 12A.96 for detailed definitions, footnotes and caveats. b The ACT and NT data are not published due to insufficient observations.

12.4 Future directions in performance reporting

Priorities for future reporting on mental health management include the following:

- developing an estimate of the number of people who need mental health services so that access to services can be measured in terms of need
- improving reporting on government funded non-government entities to include information on their activity and the outcomes of the consumers of these services
- identifying indicators that relate to the performance framework dimension of sustainability
- further developing the measurement and reporting on the clinical mental health outcomes of consumers of specialised public mental health services.

12.5 Definitions of key terms

General terms General practice

The organisational structure in which one or more GPs provide and supervise health care for a 'population' of patients. This definition includes medical practitioners who work solely with one specific population, such as women's health or Aboriginal and Torres Strait Islander health.

Health management

The ongoing process beginning with initial client contact and including all actions relating to the client. Includes assessment/evaluation, education of the person, family or carer(s), and diagnosis and treatment. Involves problems with adherence to treatment and liaison with, or referral to, other agencies.

Separation

An episode of care for an admitted patient, which can be a total hospital stay, or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute to rehabilitation). Separation also means the process by which an admitted patient completes an episode of care.

Mental health Acute services

Services that primarily provide specialised psychiatric care for people with acute episodes of mental illness. These episodes are characterised by recent onset of severe clinical symptoms of mental illness that have potential for prolonged dysfunction or risk to self and/or others. The key characteristic of acute services is that the treatment effort focuses on symptom reduction with a reasonable expectation of substantial improvement. In general, acute psychiatric services provide relatively short term treatment. Acute services can:

- focus on assisting people who have had no prior contact or previous psychiatric history, or individuals with a continuing psychiatric illness for whom there has been an acute exacerbation of symptoms
- target the general population or be specialised in nature, targeting specific clinical populations. The latter group include psychogeriatric, child and adolescent, youth and forensic mental health services.

Accrued mental health patient days

Mental health care days are days of admitted patient care provided to admitted patients in psychiatric hospitals, designated psychiatric units and days of residential care provided to residents in residential mental health services. Accrued mental health care days can also be referred to as occupied bed days in specialised mental health services. The days to be counted are only those days occurring within the reference period, that is from 1 July to the

following 30 June for the relevant period, even if the patient/resident was admitted prior to the reference period or discharged after the reference period. The key basic rules to calculate the number of accrued mental health care days are as follows:

- For a patient admitted and discharged on different days, all days are counted as mental health care days except the day of discharge and any leave days.
- Admission and discharge on the same day are equal to one patient day.
- Leave days involving an overnight absence are not counted.
- A patient day is recorded on the day of return from leave.

Ambulatory care services

Affective disorders

A mood disturbance, including mania, hypomania, bipolar affective disorder, depression and dysthymia.

Mental health services dedicated to the assessment, treatment, rehabilitation or care of non-admitted inpatients, including but not confined to crisis assessment and treatment services, mobile assessment and treatment services, outpatient clinic services (whether provided from a hospital or community mental health centre), child and adolescent outpatient treatment teams, social and living skills programs (including day programs, day hospitals and living skills centres), and psychogeriatric assessment teams and day programs.

Anxiety disorders

Feelings of tension, distress or nervousness. Includes agoraphobia, social phobia, panic disorder, generalised anxiety disorder, obsessive-compulsive disorder and post-traumatic stress disorder.

Average available beds

The number of beds available to provide overnight accommodation for patients admitted to hospital (other than neonatal cots [non-special-care] and beds occupied by hospital-in-the-home patients) or to specialised residential mental health care, averaged over the counting period. Beds are available only if they are suitably located and equipped to provide care and the necessary financial and human resources can be provided.

Child and adolescent mental health services

Services principally targeted at children and young people up to the age of 18 years. Classification of services in this category requires recognition by the regional or central funding authority of the special focus of the inpatient service on children or adolescents. These services can include a forensic component.

Community-based residential services

Staffed residential units established in community settings that provide specialised treatment, rehabilitation or care for people affected by a mental illness or psychiatric disability. To be defined as community-based residences, the services must: provide residential care to people with mental illnesses or psychiatric disability; be located in a community setting external to the campus of a general hospital or psychiatric institution; employ onsite staff for at least some part of the day; and be government funded.

Co-morbidity

The simultaneous occurrence of two or more illnesses such as depressive illness with anxiety disorder, or depressive disorder with anorexia.

Comparability

Data are considered comparable if (subject to caveats) they can be used to inform an assessment of comparative performance. Typically, data are considered comparable when they are collected in the same way and in accordance with the same definitions. For comparable indicators or measures, significant differences in reported results allow an assessment of differences in performance, rather than being the result of anomalies in the data.

Completeness

Data are considered complete if all required data are available for all jurisdictions that provide the service.

Cost per inpatient bed day Depression

The average patient day cost according to the inpatient type.

A state of gloom, despondency or sadness lasting at least two weeks. The person usually suffers from low mood, loss of interest and enjoyment, and reduced energy. Sleep, appetite and concentration can be affected.

Forensic mental health services

Services principally providing assessment, treatment and care of mentally ill individuals whose behaviour has led them to commit criminal offences or makes it likely that they will offend in the future if not adequately treated and contained. This includes prison-based services, but excludes services that are primarily for children and adolescents and for older people even where they

General mental health services

include a forensic component.

Services that principally target the general adult population

(18-65 years old) but that can provide services to children, adolescents or older people. Includes, therefore, those services that cannot be described as specialised child and adolescent, youth, older people's or forensic services.

General mental health services include hospital units whose principal function is to provide some form of specialised service to the general adult population (for example, inpatient psychotherapy) or to focus on specific clinical disorders within the adult population (for example, postnatal depression, anxiety disorders).

Mental illness

A diagnosable illness that significantly interferes with an individual's cognitive, emotional and/or social abilities.

Mental health

The capacity of individuals within groups and the environment to interact with one another in ways that promote subjective wellbeing, the optimal development and use of mental abilities (cognitive, affective and relational) and the achievement of individual and collective goals consistent with justice. Diminished cognitive, emotional or social abilities, but not to the extent of

Mental health problems

meeting the criteria for a mental illness. Mental health promotion

Actions taken to maximise mental health and wellbeing among populations and individuals. It is aimed at changing environments (social, physical, economic, educational, cultural) and enhancing the 'coping' capacity of communities, families and individuals by giving power, knowledge, skills and necessary resources.

Mental illness prevention

Interventions that occur before the initial onset of an illness to prevent its development. The goal of prevention interventions is to reduce the incidence and prevalence of mental health problems and mental illnesses.

Non-acute services

Non-acute services are defined by two categories:

- Rehabilitation services that have a primary focus on intervention to reduce functional impairments that limit the independence of patients. Rehabilitation services are focused on disability and the promotion of personal recovery. They are characterised by an expectation of substantial improvement over the short to mid-term. Patients treated by rehabilitation services usually have a relatively stable pattern of clinical symptoms.
- Extended care services that primarily provide care over an indefinite period for patients who have a stable but severe level of functional impairment and an inability to function independently, thus requiring extensive care and support. Patients of extended care services present a stable pattern of clinical symptoms, which can include high levels of severe unremitting symptoms of mental illness. Treatment is focused on preventing deterioration and reducing impairment; improvement is expected to occur slowly.

Non-government organisations (NGOs)

Private not-for-profit community managed organisations that receive State and Territory government funding specifically for the purpose of providing community support services for people affected by a mental illness or psychiatric disability. Programs provided by the NGOs sector can include supported accommodation services (including community-based crisis and respite beds), vocational rehabilitation programs, advocacy programs (including system advocacy), consumer self-help services, and support services for families and primary carers.

Older people's mental health services

Services principally targeting people in the age group 65 years or over. Classification of services in this category requires recognition by the regional or central funding authority of the special focus of the inpatient service on aged people. These services can include a forensic component. Excludes general mental health services that may treat older people as part of a more general service.

Outpatient services — community-based Services primarily provided to non-admitted patients on an appointment basis and delivered from health centres located in community settings, physically separated within hospital sites. They can include outreach or domiciliary care as an adjunct to services provided from the centre base.

Outpatient services - hospital-based

Services primarily provided to non-admitted patients on an appointment basis and delivered from clinics located within hospitals. They can include outreach or domiciliary care as an adjunct to services provided from the clinic base.

Outcomes measurement calculating the consumers 'score'.

The assessment of a consumer's clinical mental health outcomes is based on the changes reported in a consumer's 'score' on a rating scale known as the Health of the Nation Outcomes Scale (HoNOS), or for children and adolescents, the Health of the Nation Outcome Scales for Children and Adolescents (HoNOSCA). Outcome scores are classified based on effect size a statistic used to assess the magnitude of a treatment effect

(AHMC 2012). The effect size is based on the ratio of the difference between the pre- and post-scores to the standard deviation of the pre-score. Individual episodes are classified as 'significant improvement' if the effect size index is greater than or equal to positive 0.5; 'no change' if the index is between 0.5 and -0.5; and 'significant deterioration' if the effect size index is less than or

equal to -0.5 (AHMC 2012)

The number of cases of a disease present in a population at a given time (point prevalence) or during a given period (period prevalence).

Preventive interventions

Programs designed to decrease the incidence, prevalence and negative outcomes of illnesses.

Psychiatrist Public health

Prevalence

A medical practitioner with specialist training in psychiatry.

The organised, social response to protect and promote health, and to prevent illness, injury and disability. The starting point for identifying public health issues, problems and priorities, and for designing and implementing interventions, is the population as a whole or population subgroups. Public health is characterised by a focus on the health of the population (and particular at-risk groups) and complements clinical provision of health care services.

Public (non-psychiatric) hospital

A hospital that provides at least minimum medical, surgical or obstetric services for inpatient treatment and/or care, and around-the-clock, comprehensive, qualified nursing services, as well as other necessary professional services.

Schizophrenia

Seclusion

A combination of signs and symptoms that can include delusions, hallucinations, disorganised speech or behaviour, a flattening in emotions, and restrictions in thought, speech and goal directed behaviour.

Seclusion is the confinement of the consumer at any time of the day or night alone in a room or area from which free exit is prevented. The intended purpose of the confinement is not relevant in determining what is or is not seclusion. Seclusion applies even if the consumer agrees or requests the confinement (NMHPSC 2011b).

The awareness of the consumer that they are confined alone and denied exit is not relevant in determining what is or is not seclusion. The structure and dimensions of the area to which the consumer is confined is not relevant in determining what is or is not seclusion. The area may be an open area, for example, a courtyard. Seclusion does not include confinement of consumers to High Dependency sections of gazetted mental health units, unless it meets the definition (AIHW 2015).

Seclusion event

An event is when a consumer enters seclusion and when there is a clinical decision to cease seclusion. Following the clinical decision to cease seclusion, if a consumer re-enters seclusion within a short period of time this would be considered a new seclusion event. The term 'seclusion event' is utilised to differentiate it from the different definitions of 'seclusion episode' used across jurisdictions (NMHPSC 2011b).

Specialised mental health inpatient services Specialised mental health services

Services provided to admitted patients in stand-alone psychiatric hospitals or specialised psychiatric units located within general hospitals.

Services whose primary function is specifically to provide treatment, rehabilitation or community support targeted towards people affected by a mental illness or psychiatric disability. Further, such activities are delivered from a service or facility that is readily identifiable as both specialised and serving a mental health function. This criterion applies regardless of the source of funds.

Specialised residential services

Services provided in the community that are staffed by mental health professionals on a non-24 or 24-hour basis.

Staffing categories (mental health)

Medical officers: all medical officers employed or engaged by the organisation on a full time or part time basis. Includes visiting medical officers who are engaged on an hourly, sessional or fee-for-service basis.

Psychiatrists and consultant psychiatrists: medical officers who are registered to practice psychiatry under the relevant State or Territory medical registration board; or who are fellows of the Royal Australian and New Zealand College of Psychiatrists or registered with Health Insurance Commission as a specialist in Psychiatry.

Psychiatry registrars and trainees: medical officers who are formal trainees within the Royal Australian and New Zealand College of Psychiatrists' Postgraduate Training Program.

Other medical officers: medical officers employed or engaged by the organisation who are not registered as psychiatrists within the State or Territory, or as formal trainees within the Royal Australian and New Zealand College of Psychiatrists' Postgraduate Training Program.

Nursing staff: all categories of registered nurses and enrolled nurses, employed or engaged by the organisation.

Registered nurses: people with at least a three year training certificate or tertiary qualification who are certified as being a registered nurse with the State or Territory registration board. This is a comprehensive category and includes general and specialised categories of registered nurses.

Enrolled nurses: refers to people who are second level nurses who are enrolled in all states except Victoria where they are registered by the state registration board to practise in this capacity. Includes general enrolled nurse and specialist enrolled nurse (e.g. mothercraft nurses in some states).

Diagnostic and health professionals (allied health professionals): qualified staff (other than qualified medical or nursing staff) who are engaged in duties of a diagnostic, professional or technical nature. This category covers all allied health professionals, such as social workers, psychologists, occupational therapists, physiotherapists, and other diagnostic and health professionals. Social workers: people who have completed a course of recognised training and are eligible for membership of the Australian Association of Social

and are eligible for membership of the Australian Association of Social Workers.

Psychologists: people who are registered as psychologists with the relevant State or Territory registration board.

Occupational therapists: people who have completed a course of recognised training and who are eligible for membership of the Australian Association of Occupational Therapists.

Other personal care staff: attendants, assistants, home companions, family aides, ward helpers, warders, orderlies, ward assistants and nursing assistants who are engaged primarily in the provision of personal care to patients or residents, and who are not formally qualified or who are undergoing training in nursing or allied health professions.

Administrative and clerical staff: staff engaged in administrative and clerical duties. Excludes medical, nursing, diagnostic and health professional and domestic staff wholly or partly involved in administrative and clerical duties, who should be counted under their appropriate occupational categories. Civil engineers and computing staff are included in this category.

Domestic and other staff: staff involved in the provision of food and cleaning services including domestic staff primarily engaged in administrative duties such as food services manager. Dieticians are excluded.

Health establishments that are primarily devoted to the treatment and care of inpatients with psychiatric, mental or behavioural disorders, and that are situated at physically separate locations from a general hospital. Stand-alone hospitals may or may not be managed by the mainstream health system. Psychiatric hospitals situated at physically separate locations from a general hospital are included within the 'stand-alone' category regardless of whether they are under the management control of a general hospital. A health establishment that operates in a separate building but is located on, or immediately adjoining, the acute care hospital campus can also be a stand-alone hospitals if the following criteria are not met:

- a single organisational or management structure covers the acute care hospital and the psychiatric hospital
- a single employer covers the staff of the acute care hospital and the psychiatric hospital

Psychiatric hospitals

- the location of the acute care hospital and psychiatric hospital can be regarded as part of a single overall hospital campus
- the patients of the psychiatric hospital are regarded as patients of the single integrated health service.

Substance use disorders

Disorders in which drugs or alcohol are used to such an extent that behaviour becomes maladaptive, social and occupational functioning is impaired, and control or abstinence becomes impossible. Reliance on the drug can be psychological (as in substance misuse) or physiological (as in substance dependence).

Youth mental health services

Services principally targeting children and young people generally aged 16-25 years. The classification of a service into this category requires recognition by the regional or central funding authority of the special focus of the service. These services may include a forensic component.

12.6 List of attachment tables

Attachment tables are identified in references throughout this chapter by a '12A' prefix (for example, table 12A.1). Attachment tables are available on the website (www.pc.gov.au/rogs/2016).

12A Mental health management — attachment

Definitions for the indicators and descriptors in this attachment are in section 12.5 of the chapter. Unsourced information was obtained from the Australian, State and Territory governments.

Data in this Report are examined by the Health Working Group, but have not been formally audited by the Secretariat.

Data reported in the attachment tables are the most accurate available at the time of data collection. Historical data may have been updated since the last edition of RoGS.

This file is available in Adobe PDF format on the Review web page (www.pc.gov.au/rogs/2016).

- (a) Detailed notes on how estimates specific to Commonwealth mental health specific expenditure are derived are provided in the AIHW Mental Health Services in Australia on-line publication. See http://mhsa.aihw.gov.au/resources/expenditure/data-source/.
- (b) Estimated Australian Government expenditure shown in the table covers only those areas of expenditure that have a clear and identifiable mental health purpose. A range of other expenditure, both directly and indirectly related to provision of support for people affected by mental illness, is not covered in the table.
- (c) Time series financial data are adjusted to 2013-14 dollars using the implicit price deflator for general government final consumption expenditure on hospital and nursing home services (table 12A.98).
- (d) Mental health specific payments to states and territories: For years up to 2008-09, this category covers specific payments made to states and territories by the Australian Government for mental health reform under the Medicare Agreements 1993–1998, and Australian Health Care Agreements 1998–2003 and 2008-09. From July 2009 the Australian Government provided special purpose payments (SPP) to State and Territory governments under the National Healthcare Agreement (NHA) that do not specify the amount to be spent on mental health or any other health area. As a consequence, specific mental health funding cannot be identified under the NHA. From 2008-09 onwards, the amounts include: National Perinatal Depression Plan Payments to States, National Partnership Supporting Mental Health Reform and specific payments to Tasmania under the Tasmanian Health Assistance Package. Note that the expenditure reported here excludes payments to states and territories for the development of subacute mental health beds made under Schedule E of the National Partnership Agreement Improving Public Hospital Services, which will total \$175 million over the period 2010-11 to 2013-14. Mental-health specific payments cannot be separately identified from payments for other categories of subacute beds made to states and territories.

Table 12A.1 Real estimated Australian Government expenditure on mental health services (2013-14 dollars) (\$million) (a), (b), (c)

2005-06 2006-07 2007-08 2008-09 2009-10 2010-11 2011-12 2012-13 2013-14

- (e) National programs and initiatives (Department of Health managed): This category of expenditure includes the expenditure groups described in the AIHW Mental Health Services in Australia on-line publication. See http://mhsa.aihw.gov.au/resources/expenditure/data-source/. Expenditure reported under the item 'Indigenous social and emotional wellbeing programmes' has previously been reported under 'National programs and initiatives (Department of Health managed)'. This expenditure is now separately reported following the transfer of the former Office for Aboriginal and Torres Strait Islander Health (OATSIH) Social and Emotional Wellbeing program to the Department of Prime Minister and Cabinet. Adjustments have been made to all years.
- (f) National programs and initiatives (Department of Social Services [DSS] managed, before September 2013 it was Families, Housing, Community Services and Indigenous Affairs [FaHCSIA]): Expenditure on DSS/FaHCSIA-managed Council of Australian Governments (COAG) Action Plan programs refers to funding outlays on three initiatives funded by the Australian Government under the COAG Action Plan on Mental Health (Personal Helpers and Mentors, More Respite Care Places to Help Families and Carers, Family Mental Health Support Services (previously referred to as Community based programmes to help families coping with mental illness). 2013-14 expenditure also includes expenditure on new Community Mental Health drought assistance measure.
- (g) National programs and initiatives (Department of Veterans' Affairs [DVA] managed): This category of expenditure includes the groups described in the AIHW Mental Health Services in Australia on-line publication. See http://mhsa.aihw.gov.au/resources/expenditure/data-source/.
- (h) Department of Defence-funded programs: Expenditure reporting commences at 2009-10, and covers a range of mental health programs and services delivered to ADF personnel. Increased expenditure over the period reflects, in part, increased accuracy of data capture. Details of the ADF Mental Health Strategy are available at http://www.defence.gov.au/health/dmh/i-dmh.htm. Data are not available for 2013-14.
- (i) National Suicide Prevention Program: Expenditure reported includes all Australian Government allocations made under the national program, including additional funding made available under the COAG Action Plan and the 2010-11 and 2011-12 Federal Budgets.
- (j) Indigenous social and emotional wellbeing programmes: Previously reported under 'National programmes and initiatives (Health managed)' up to 2012-13 but has been separately identified following the transfer of the former OATSIH Social and Emotional Wellbeing program to the Department of Prime Minister and Cabinet.
- (k) Medicare Benefits Schedule Psychiatrists: Expenditure reported refers to benefits paid for services by consultant psychiatrists processed in each of the index years. The amounts reported exclude payments made by the Department of Veterans' Affairs under the Repatriation Medical Benefits Schedule. These are included under the Department of Veterans' Affairs expenditure.

Table 12A.1 Real estimated Australian Government expenditure on mental health services (2013-14 dollars) (\$million) (a), (b), (c)

2005-06 2006-07 2007-08 2008-09 2009-10 2010-11 2011-12 2012-13 2013-14

- (I) Medicare Benefits Schedule General Practitioner: Prior to 2006-07, General Practitioner mental health-related expenditure was based on a crude estimate of 6.1 per cent of total MBS benefits paid for GP attendances, and derived from data and assumptions as detailed in the National Mental Health Report 2007. This estimate was historical and aimed to recognise that, although few mental health specific items were available in the MBS to accurately monitor GP mental health service provision, GPs are a significant provider of services to people with mental illness. Commencing November 2006, new mental health specific GP items were introduced under the Better Access to Mental Health Care initiative. To incorporate these changes, GP expenditure reported for 2006-07 is based on total MBS benefits paid against these new mental health specific items, plus an additional 6.1 per cent of total GP Benefits paid in the period preceding the introduction of the new items (July and November 2006).

 From 2007-08 onwards, expenditure on GP mental health care is based solely on benefits paid against MBS mental health specific GP items, which are predominantly the Better Access GP mental health items plus a small number of other items that were created in the years preceding the introduction of the Better Access initiative. This method provides a significantly lower expenditure figure than obtained using the 6.1 per cent estimate of previous years because it
- (m) Medicare Benefits Schedule Psychologists/Allied Health: Expenditure refers to MBS benefits paid for Clinical Psychologists, Psychologists, Social Workers and Occupational Therapists under the new items introduced through the Better Access to Mental Health Care initiative on 1 November 2006, plus a small number of Psychologist/Allied health items that were created under the Enhanced Primary Care program in the years preceding the introduction of the Better Access initiative.

is conservative and does not attempt to assign a cost to the range of GP mental health work that is not billed as a specific mental health item. Comparisons of GP mental health related expenditure reported pre- and post-2006-07 are therefore not valid as the apparent decrease reflects the different approach to

- (n) Pharmaceutical Benefits Scheme: Expenditure under the Pharmaceutical Benefits Scheme refers to all Australian Government benefits for psychiatric medication in each of the index years, defined as drugs included in the following classes of the Anatomical Therapeutic Chemical Drug Classification System: antipsychotics (except prochloperazine); anxiolytics; hypnotics and sedatives; psychostimulants; and antidepressants. Expenditure on Clozapine, funded under the Highly Specialised Drugs Program, has been included for all years, including Clozapine dispensed through public hospitals. The amounts reported exclude payments made by the Department of Veterans' Affairs under the Repatriation Pharmaceutical Benefits Schedule. These are included under the Department of Veterans' Affairs expenditure.
- (o) Private Health Insurance Premium Rebates: Estimates of the 'mental health share' of Australian Government Private Health Insurance Rebates are derived from a combination of sources and based on the assumption that a proportion of Australian Government outlays designed to increase public take up of private health insurance have subsidised private psychiatric care in hospitals. The methodology underpinning these estimates is described in the AIHW Mental Health Services in Australia on-line publication. See http://mhsa.aihw.gov.au/resources/expenditure/data-source/
- (p) Research: Research funding represents the value of mental health related grants administered by the National Health and Medical Research Council (NHMRC) during the relevant year. Data were sourced from the NHMRC website: http://www.nhmrc.gov.au/grants-funding/research-funding-statistics-and-data/mental-health-nhpa, accessed 28 September 2015. Historical adjustments were made to most years preceding 2013-14.

- (a) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).
- (b) Estimates of State and Territory government funds include Australian government funding provided under the Australian Health Care Agreement base grants/NHA SPP.
- (c) Depreciation is excluded for all years.
- (d) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (e) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (f) The Australian total for mental health specific payments to states and territories can differ slightly to those in table 12A.1 as in that table the deflator for Australia is used, whereas in this table State or Territory specific deflators are used and the Australian total is the sum of states and territories.
- (g) Mental health specific payments to states and territories: For years up to 2008-09, this category covers specific payments made to states and territories by the Australian Government for mental health reform under the Medicare Agreements 1993–1998, and Australian Health Care Agreements 1998–2003 and 2008-09. From July 2009, the Australian Government provided SPP to State and Territory governments under the NHA that do not specify the amount to be spent on mental health or any other health area. As a consequence, specific mental health funding cannot be identified under the NHA. From 2008-09 onwards, the amounts include: National Perinatal Depression Plan Payments to States, National Partnership Supporting Mental Health Reform and specific payments to Tasmania under the Tasmanian Health Assistance Package. Note that the expenditure reported here excludes payments to states and territories for the development of subacute mental health beds made under Schedule E of the National Partnership Agreement Improving Public Hospital Services, which will total \$175 million over the period 2010-11 to 2013-14. Mental-health specific payments cannot be separately identified from payments for other categories of subacute beds made to states and territories.
- (h) Department of Veterans' Affairs: This category of expenditure includes the groups described in the AIHW Mental Health Services in Australia on-line publication. See http://mhsa.aihw.gov.au/resources/expenditure/data-source/.

| 2013-14 | 17.0 | 18.5 | 8.3 | 8.4 | 5.9 | _ | _ | _ | 58.0 |

⁽a) See the AIHW Mental Health Services in Australia on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure estimates.

- (b) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (c) The quality of the NSW 2010-11 MHE NMDS data has been affected by the reconfiguration of the service system during the year.
 - Nil or rounded to zero.

⁽a) Expenditure is current prices for all years and includes all spending, regardless of source of funds.

⁽b) Depreciation is excluded for all years.

⁽c) See the AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure estimates.

Table 12A.6 Total state and territory recurrent expenditure on specialised mental health services (current prices) (a), (b), (c), (d), (e)

NSW (f) Vic Qld (g) WA SA Tas (h) ACT NT Aust

- (d) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (e) Totals may not add due to rounding.
- (f) The quality of the NSW 2010-11 MHE NMDS data has been affected by the reconfiguration of the service system during the year.
- (g) Queensland does not fund community residential services, however, it funds a number of extended treatment services, both campus and non-campus based, which provide longer term inpatient treatment and rehabilitation services with a full clinical staffing 24 hours a day seven days a week. In addition, Queensland have advised that funding to non-government services for psychiatric disability support services is administered either by Queensland Health or Disability Services Queensland (DSQ).
- (h) For Tasmania, in 2005-06, non-government organisations (NGOs) providing residential services were included for the first time in the community residential category. As these NGOs are now categorised as residential services, NGO funding decreased from previous years. Indirect/residual expenditure represents State indirect/residual expenditure. If organisational indirect expenditure were included this expenditure would have been \$10,719,100.
- (i) Includes expenditure on public hospital services managed and operated by private and non-government entities.
- (j) For SA, the increases in admitted patient and ambulatory care expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.

.. Not applicable.

| Ideation (f) | 71.7 ± 8.7 | 28.3 ± 8.7 | 100.0 |
| Plans | 77.5 ± 12.6 | 22.5*± 12.6 | 100.0 |
| Attempts | 94.2 ± 9.0 | 5.8** ± 8.9 | 100.0 |
| No suicidal behaviours | 18.7 ± 1.1 | 81.3 ± 1.1 | 100.0 |
| Total people aged 16–85 years | 20.0 ± 1.1 | 80.0 ± 1.1 | 100.0 |

- (a) The rates reported in this table include 95 per cent confidence intervals (for example, X per cent ± X per cent). A '*' indicates a relative standard error (RSE) of between 25 per cent and 50 per cent. Estimates with RSEs greater than 25 per cent should be used with caution. A '**' indicates a RSE of greater than 50 per cent. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.
- (b) People who met criteria for diagnosis of a lifetime mental disorder (with hierarchy) and had symptoms in the 12 months prior to interview.
- (c) Level of psychological distress is measured by the Kessler Psychological Distress Scale (K10), from which a score of 10 to 50 is produced. Higher scores indicate a higher level of distress; low scores indicate a low level of distress. Scores are grouped as follows: Low 10–15, Moderate 16–21, High 22–29, and Very high 30–50.
- (d) Disability status relates to whether a person has disability, a core-activity limitation (mild, moderate, severe or profound), or a schooling or employment restriction.
- (e) People who were unable to carry out or had to cut down on their usual activities in the 30 days prior to interview. Total includes 'not stated'.
- (f) Suicidal ideation refers to the presence of serious thoughts about committing suicide.

- (a) Denominator includes a small number of persons for whom levels of psychological distress were unable to be determined.
- (b) Adults are defined as persons aged 18 years and over.
- (c) Rates are age standardised by State and Territory, to the June 2001 Estimated Resident Population (5 year ranges from 18 for adults).
- (d) Estimates with a "*" have a relative standard error between 25 per cent and 50 per cent and should be used with caution.
- (e) Data for NT should be interpreted with caution as the *Australian Health Survey (AHS) (2011-12 National Health Survey [NHS] component)* excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

SEIFA = Socio-Economic Indexes for Areas

- (d) Rates are age standardised by State and Territory, to the June 2001 Estimated Resident Population (5 year ranges from 18 for adults).
- (e) Estimate with a "*" have a relative standard error between 25 per cent and 50 per cent and should be used with caution.
 - .. Not applicable. Nil or rounded to zero. **np** Not published.

Source: ABS (unpublished) NHS 2007-08, Cat. no. 4364.0.

⁽a) Adults are defined as people aged 18 years and over.

⁽b) Psychological distress levels derived from the K10. Denominator includes a small number of people for whom levels of psychological distress were unable to be determined.

⁽c) Data for NT should be interpreted with caution as the *NHS* 2007-08 excluded very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

|-----|-----|-----|----|----|-----|-----|--------|------|

- (a) Derived from the Kessler Psychological Distress Scale–10 items (K10). This is a scale of non-specific psychological distress based on 10 questions about negative emotional states in the 4 weeks prior to interview. The K10 is scored from 10 to 50, with higher scores indicating a higher level of distress; low scores indicate a low level of distress. Scores are grouped as follows: Low 10–15, Moderate 16–21, High 22–29, and Very high 30–50.
- (b) A '*' indicates a RSE of between 25 per cent and 50 per cent. Estimates with RSEs greater than 25 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use. These estimates are not published.
- (c) Separate estimates for the NT are not available for some estimates from this survey, but the NT contributes to national estimates. Data for NT should be interpreted with caution as the NHS 2007-08 excluded very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (d) Totals include not stated.

np Not published.

⁽a) Levels of psychological distress are derived from the Kessler Psychological Distress Scale (K5). Denominator includes a small number of persons for whom levels of psychological distress were unable to be determined.

Source: ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey, 2012-13 (National Aboriginal and Torres Strait Islander Health Survey component); ABS (unpublished) AHS 2011-13 (2011-12 NHS component).

⁽b) Rates are age standardised by State and Territory, to the June 2001 Estimated Resident Population (10 year ranges from 18 years).

⁽c) Adults are defined as persons aged 18 years and over.

⁽d) Totals for Aboriginal and Torres Strait Islander people exclude a small number of persons for whom responses were provided by proxy but who were not present at interview.

⁽e) Data for NT should be interpreted with caution as the AHS 2011–13 (2011-12 NHS component) excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

⁽a) Psychological distress as measured by the Kessler 10 scale.

⁽b) A '*' indicates that an estimate has a RSE of between 25 per cent and 50 per cent and should be used with caution.

⁽c) Separate estimates for the NT are not available for this survey, but the NT contributes to national estimates.

⁽d) Totals include not stated.

⁽a) State and territory is based on the postcode of the mailing address of the patient as recorded by Medicare Australia. Provider type is based on the MBS item numbers claimed.

⁽b) A listing of the MBS items associated with each of the categories is available in the Medicare Benefits Schedule and General practice data source sections of the *Mental Health Services in Australia* (various issues), (http://mhsa.aihw.gov.au/home/).

⁽c) Includes consultations in consulting room, hospital and home visits.

⁽d) Includes attendances in consulting room, hospital and other locations.

⁽e) Data for electroconvulsive therapy may include services provided by medical practitioners other than psychiatrists.

- (f) Mental health workers include psychologists, mental health nurses, occupational therapists, social workers and Aboriginal health workers.
- (g) Crude rates based on the preliminary Australian estimated resident population as at 31 December mid-point of financial year.
- (h) Totals for psychologist/other psychologist and other allied health services include specific services for Aboriginal and Torres Strait Islander Australians that were introduced on 1 November 2008.
- (i) This item is for the initiation of management of anaesthesia for electroconvulsive therapy and includes data for services provided by medical practitioners other than GPs.
 - Nil or rounded to zero. **np** Not published.

⁽a) The confidence intervals show that the difference between some of the years is not statistically significant.

Source: AIHW (2015) Mental Health Services in Australia (available at http://mhsa.aihw.gov.au/home/).

⁽b) The estimated number of encounters is based on the proportion of encounters in the BEACH survey of general practice activity that are mental health-related, multiplied by the total number of Medicare services for non-Referred (GP) Attendances (excluding practice nurse items) as reported by the Department of Human Services (see Mental Health Services in Australia for more details).

⁽c) Crude rate is based on the Australian estimated resident population as at 31 December of the reference year.

⁽a) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of patient day estimates.

- (b) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (c) Hospital patient days include those provided in services funded by government, but managed and operated by private and non-government entities.
- (d) Caution is required when interpreting NSW data. Seven residential mental health services in 2006–07 were reclassified as non-acute older person specialised hospital services in 2007–08, reflecting a change in function of those units.
- (e) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (f) Queensland does not fund community residential services; however, it funds a number of campus based and non-campus based extended treatment services.

 Data from these services are included as non-acute units.
- (g) Caution is required when interpreting WA data. Several residential services that reported as 24-hour staffed services in 2009-10 transitioned to a non-24-hour staffed model of care as of 1 July 2010. In addition, a review of services resulted in the reclassification of beds between the acute and non-acute categories for the 2010–11 collection, to more accurately reflect the function of these services.
- (h) The ACT and the NT do not have non-acute hospital units.
 - .. Not applicable.

Table 12A.22 Admitted patient mental health-related separations with specialised psychiatric care, by principal diagnosis in ICD-10-AM and hospital type (a)

| | Public | Public | | |
|--------|-----------|-------------|-------|----------|
| ICD-10 | acute | psychiatric | Total | Per cent |
| | hospitals | hospitals | | |

- (a) Admitted patient separations refers to those non-ambulatory separations when a patient undergoes a hospital's formal admission process, completes an episode of care and 'separates' from the hospital, excluding ambulatory-equivalent separations. Separations for which care type was reported as Newborn with no qualified days and records for Hospital boarders and Posthumous organ procurement have been excluded.
- (b) Includes ICD-10-AM codes Z00.4, Z03.2, Z04.6, Z09.3, Z13.3, Z54.3, Z61.9, Z63.1, Z63.8, Z63.9, Z65.8, Z65.9, Z71.4, Z71.5 and Z76.0.
- (c) Includes separations for which the principal diagnosis was any other mental health-related principal diagnosis.
- (d) Includes all other codes not included as a mental health principal diagnosis.
 - Nil or rounded to zero. np Not published.

Table 12A.23 Ambulatory-equivalent public mental health-related separations with specialised psychiatric care, by principal diagnosis, 2012-13 (a)

| ICD-10-AM code | | Number of separations | Proportion of total separations |
|----------------|---|-----------------------|---------------------------------|
| F00-F09 | Organic, including symptomatic, mental disorders | 26 | 0.3 |
| F10–F19 | Mental and behavioural disorders due to psychoactive substance use | 336 | 3.3 |
| F20-F29 | Schizophrenia, schizotypal and delusional disorders | 604 | 6.0 |
| F30-F39 | Mood (affective) disorders | 2 384 | 23.7 |
| F40–F48 | Neurotic, stress-related and somatoform disorders | 2 878 | 28.6 |
| F50–F59 | Behavioural syndromes associated with physiological disturbances and physical factors | 1 425 | 14.2 |
| F60-F69 | Disorders of adult personality and behaviour | 206 | 2.0 |
| F70-F79 | Mental retardation | 60 | 0.6 |
| F80-F89 | Disorders of psychological development | 225 | 2.2 |
| F90–F98 | Behavioural and emotional disorders with onset usually occurring in childhood and adolescence | 1 082 | 10.8 |
| F99 | Mental disorder not otherwise specified | 4 | _ |
| G30 | Alzheimer's disease | 24 | 0.2 |
| | Other factors related to mental and behavioural disorders and substance use (b) | 113 | 1.1 |
| | Other specified mental health-related principal diagnosis (c) | 81 | 0.8 |
| | Other (d) | 609 | 6.1 |
| Total | | 10 057 | 100.0 |

⁽a) Includes separations for both public acute and public psychiatric hospitals.

Source: AIHW (2015) Mental Health Services in Australia (available at http://mhsa.aihw.gov.au/home/).

⁽b) Includes ICD-10-AM codes Z00.4, Z03.2, Z04.6, Z09.3, Z13.3, Z54.3, Z61.9, Z63.1, Z63.8, Z63.9, Z65.8, Z65.9, Z71.4, Z71.5 and Z76.0.

⁽c) Includes separations for which the principal diagnosis was any other mental health-related principal diagnosis.

⁽d) Includes all other codes not included as a mental health principal diagnosis.

⁻ Nil or rounded to zero.

⁽a) Includes service contacts for which age group was not reported.

⁽b) Includes service contacts for which sex and/or age group was not reported.

⁽c) Total rates for males, females and all were directly age-standardised for data up to 2012-13. Age rates are crude rates, as detailed in Technical information—see Technical notes section of *Mental Health Services in Australia* online.

Table 12A.24 Community mental health service contacts, by sex and age group

NSW Vic Qld WA SA Tas ACT NT Aust

- (d) Data were not available for Victoria in 2011–12 or 2012-13 due to service level collection gaps resulting from protected industrial action during this period. Victoria required that data for 2011–12 and 2012-13 be excluded from all totals, with no proxy data to be included for Victoria when calculating national totals. Industrial action in Tasmania in 2011–12 and 2012-13 has affected the quality and quantity of Tasmania's data (see the online data source of the Community mental health care section).
- (e) Totals include only those jurisdictions that provided data. Rates for 2011-12 and 2012-13 were calculated using a methodology which accounts for missing data, as detailed in the online technical information. Comparisons between jurisdictions and over time should be made with caution.
- (f) SA transitioned to a new hospital-based system during 2013–14 which impacted on activity data reporting for a small number of hospital-based services.
- (g) Tasmania transitioned to a new clinical information system in 2013–14 which impacted on activity data reporting.

na Not available. .. Not applicable. – Nil or rounded to zero.

- (a) Data for episodes of community residential care should be interpreted with caution due to the varying quality and completeness of Indigenous identification across jurisdictions.
- (b) Queensland does not have any government-operated residential mental health services. Tasmanian information contains data for government-funded residential units operated by the non-government sector in that state, being the only jurisdiction providing this level of reporting. The NT did not have any community residential units in 2005-06.
- (c) For NSW, Confused and Disturbed Elderly (CADE) residential mental health services were reclassified as admitted patient hospital services from 1 July 2007. All data relating to these services have been reclassified from 2007–08 onwards. Comparison of NSW data over time therefore should be approached with caution.
- (d) The rates were directly aged standardised against the Australian Estimated Resident Population as at 30 June 2001.
- (e) Includes patients identified as being either of Aboriginal but not Torres Strait Islander origin, Torres Strait Islander but not Aboriginal origin, Aboriginal and Torres Strait Islander origin and patients identified as of Aboriginal or Torres Strait Islander origin. For admitted patient care, separations from private hospitals are also included.
- (f) The rate ratio is equal to the service use (episodes, contacts or separations) rate for Indigenous Australians divided by the service use rate for non-Indigenous Australians.
- (g) Data for community mental health service contacts should be interpreted with caution. Across jurisdictions, the data quality and completeness of Indigenous identification varies or is unknown. See *Mental Health Services in Australia* (http://mhsa.aihw.gov.au/home) for further information.
- (h) Includes data for people where Indigenous status was missing or not reported.

Table 12A.25 Specialised mental health care reported, by Indigenous status

Unit NSW Vic Qld WA SA Tas ACT NT Total

- (i) Admitted patient separations refers to those non-ambulatory separations when a patient undergoes a hospital's formal admission process, completes an episode of care and 'separates' from the hospital, excluding ambulatory-equivalent separations. Separations for which care type was reported as Newborn with no qualified days and records for Hospital boarders and Posthumous organ procurement have been excluded. Comprises separations with and without mental health-related principal diagnoses but with specialised psychiatric care.
- (j) Interpretation of differences between jurisdictions needs to be undertaken with care as they may reflect different service delivery and admission practices and/or differences in the types of establishments categorised as hospitals.
- (k) Includes only public hospital separations for the NT.
- (I) Indigenous status data for NSW, Victoria, Queensland, WA, SA and the NT public hospitals are considered to be of acceptable quality for analytical purposes. Indigenous identification is likely to be incomplete and to vary among jurisdictions. Total includes data for these jurisdictions only.
- (m) Data were not available for Victoria in 2011–12 and 2012-13 due to service level collection gaps resulting from protected industrial action during this period. Victoria required that data for 2011–12 and 2012-13 be excluded from all totals, with no proxy data to be included for Victoria when calculating national totals. Industrial action in Tasmania in 2011–12 and 2012-13 has affected the quality and quantity of Tasmania's data (see the Mental Health Services in Australia online data source of the Community mental health care section).
- (n) Totals include only those jurisdictions that provided data. Rates were calculated using a methodology which accounts for missing data, as detailed in the online technical information. Comparisons between jurisdictions and over time should be made with caution.
 - **na** Not available. .. Not applicable. Nil or rounded to zero. **np** Not published.

- (a) Bed numbers represent the average number of beds which are immediately available for use by an admitted patient or resident within the establishment. See AIHW Mental Health Services in Australia on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the bed estimates. Available beds are counted as the average of monthly available bed numbers. Available beds counts exclude beds in wards that were closed for any reason (except weekend closures for beds/wards staffed and available on weekdays only).
- (b) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (c) Hospital bed can include government funded beds managed and operated by private and non-government entities.
- (d) Community-based residential beds data include 24-hour and non-24-hour staffed units.
- (e) Caution is required when interpreting NSW data. Seven residential mental health services in 2006–07 were reclassified as non-acute older person specialised hospital services in 2007–08, reflecting a change in function of those units.
- (f) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.

- (g) Queensland does not fund community residential services, however, it funds a number of campus based and non-campus based extended treatment services. These services are reported either as wards of public acute hospitals or beds in public psychiatric hospitals. Furthermore, limiting the classification of all inpatient beds to either co-located or standalone results in the reporting of some psychogeriatric beds co-located with nursing homes being reported as 'standalone' which results in the reporting of these beds as psychiatric hospital beds in this report. In 2005-06, there was temporary closure of acute beds in one Queensland hospital and some transitional extended treatment beds were permanently closed. In addition, Queensland did not change its method for counting beds until 2007-08 (see 2011 Report for details of previous method).
- (h) Beds numbers in WA include publicly funded mental health beds in private hospitals for all years. Bed numbers in WA include emergency department observation beds in one hospital for all years prior to 2010-11.
- (i) In Tasmania, for 2005-06, non-government organisations' residential beds funded by government were included for the first time in the publicly funded community residential facilities category.
- (j) Tasmania, the ACT and the NT do not have public psychiatric hospitals.
 - .. Not applicable.

- (a) Professional categories are defined by profession rather than role. See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of staffing estimates.
- (b) Total FTE figures presented in this table can differ from those in table 12A.28. A new organisational overhead setting for reporting FTE was implemented from the 2012-13 collection period, which may result in decreased FTE in the other service setting categories for some jurisdictions. Time series analyses should be approached with caution. Care and consumer worker FTE has been included in service setting reporting since the 2012-13 collection period. These categories are not included in staff type FTE data. Comparisons between these tables should be made with caution.
- (c) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (d) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (e) Queensland implemented a new method to calculate FTE from the 2009-10 data. The new method is associated with the reduction in reported FTE so caution should be exercised when conducting time series analysis.

| Total | 102.2 | 108.1 | 99.0 | 121.7 | 123.9 | 123.3 | 101.7 | 111.8 | 107.3 |

- (a) See AIHW Mental Health Services in Australia on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of staffing estimates.
- (b) Total FTE figures in this table can differ from those in table 12A.27. A new organisational overhead setting for reporting FTE was implemented from the 2012–13 collection period, which may result in decreased FTE in the other service setting categories for some jurisdictions. Time series analyses should be approached with caution. Care and consumer worker FTE has been included in service setting reporting since the 2012–13 collection period. These categories are not included in staff type FTE data. Comparisons between these tables should be made with caution.
- (c) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (d) Caution is required when interpreting NSW data. Seven residential mental health services in 2006–07 were reclassified as non-acute older person specialised hospital services in 2007–08, reflecting a change in function of those units.
- (e) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (f) The apparent absence of community residential services in Queensland reflects Queensland's preference to describe such facilities as 'extended inpatient care'.
- (g) Queensland implemented a new method to calculate FTE from the 2009–10 data. The new method is associated with the reduction in reported FTE so caution should be exercised when conducting time series analysis.
 - .. Not applicable.

- (a) Emergency department occasions of service included are those that had a principal diagnosis that fell within the Mental and behavioural disorders chapter (Chapter 5) of ICD-10-AM (codes F00–F99) or the equivalent ICD-9-CM codes.
- (b) Victoria does not record a diagnosis for occasions of service with an episode end status of *Did not wait to be attended by a health care professional.*
- (c) Includes admissions to beds or units within the emergency department.
- (d) Patient departed without being admitted or referred to another hospital.
- (e) Patient left at own risk after being attended by a health care professional but before the non-admitted patient emergency department occasion of service was completed.
- (f) NSW and SA used a combination of ICD-9-CM and ICD-10-AM.
- (g) The number of occasions of service may not sum to the total due to missing or not reported data. Also included in the total are 6 occasions of service with an episode end status of *Died in emergency department as a non-admitted patient* and 1 occasion of service with an episode end status of *Dead on arrival, not treated in emergency department.*
- (h) Crude rate is based on the preliminary Australian estimated resident population as at 31 December 2012 and is expressed per 10 000 population as detailed in the online technical information.
 - .. Not applicable. Nil or rounded to zero.

⁽a) Clients in receipt of services include all people who received one or more community service contacts or had one or more days of inpatient or residential care in the data period.

⁽b) A new client is defined as a consumer who has not been seen in the five years preceding the first contact with a State or Territory specialised public mental health service in the data period.

Table 12A.33 New clients as a proportion of total clients under the care of State or Territory specialised public mental health services (a), (b)

Unit NSW (c), (d) Vic (e) Qld (f) WA (g) SA (h) Tas (i) ACT NT (j) Aust

- (c) NSW has implemented a Statewide Unique Patient Identifier (SUPI) for mental health care. The identification of prior contacts for mental health (MH) clients is dependent upon the SUPI, both in coverage (all clients having a SUPI) and in the resolution of possible duplicates. There are differences in the completeness of coverage between the Local Health Districts/Networks and over time. The average SUPI coverage at a State level for 2012-13 is 99.9 per cent. The numbers provided are a distinct count of individuals using the SUPI (majority) and a count of individuals at the facility level for a small percentage of clients without a SUPI in the reporting period (which may include some duplicates of those who attended multiple facilities).
- (d) For NSW, residential clients are not included because their data are manually collected without SUPI assigned, thus making the unique counts of the residential clients together with the inpatient and ambulatory clients not possible. The client base of the NSW MH residential is very small which will have minimal effect on the final result (for example, total residential MH clients in 2010-11 is 185 with 59 potential new clients, 243 total residential MH clients with 130 potential new clients in 2011-12 and 237 total residential MH clients with 131 potential new clients in 2012-13).
- (e) Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. The total only includes those jurisdictions that have provided data.
- (f) For Qld, a linkage program is utilised to link between admitted and community activity and patients.
- (g) For WA, the matching of mental health community contacts to inpatient episodes is done from 2012-13 between two separate data systems and requires the use of record linkage to be able to identify the same person in both systems. There are delays associated in the use of record linkage and these delays can result in not getting a match between a community contact and a separation when there should be one. The number of unique consumers (both total and new) could be over estimated as a result. Data before 2012-13 are based on data submitted for the National Minimum Data Set (NMDS) and have not been revised.
- (h) For SA, the new client (numerator) count is not unique: it is an aggregation of three separate databases with no linkage between them. Similarly, the total client (denominator) count is not unique: it is an aggregation of three separate databases with no linkage between them. However, the impact on the result should be minimal due to populations being relatively stable within the three respective catchments.
- (i) For Tasmania, information for years before 2012-13 were extracted from three different data sources and linked together with a Statistical Linkage Key (SLK) for each individual present in the extracts for the reporting period. While every attempt has been made to reduce any duplication of identified clients, using an SLK will lead to some duplication and can wrongly identify clients as new clients. Industrial action in Tasmania has limited the available data quality and quantity of data for 2011-12 and 2012-13. Tasmania has been progressively implementing a state-wide patient identification system. Data for 2012–13 is considered to be the first collection period with this system fully implemented. It is likely that an improved patient identification system will increase the percentage of post-discharge community care reported by Tasmania. Therefore, Tasmanian data is not comparable across years.
- (j) For the NT, for 2009-10, the count of all clients will not be exactly the same as provided in other reported collections due to non-availability of 'snapshot' or archived annual data sets.

| | Unit | NSW | Vic | Qld | WA | SA | Tas | ACT | NT | Aust (d) |
|----------------|------|------|------|------|------|------|------|-------|------|----------|
| Outer regional | % | 39.0 | 34.7 | 43.7 | 40.6 | 46.2 | 48.2 | 70.4 | 47.0 | 42.2 |
| Remote | % | 43.8 | 35.1 | 40.2 | 45.8 | 47.5 | 50.8 | na | 41.4 | 43.9 |
| Very remote | % | 36.3 | 50.0 | 39.0 | 52.4 | 36.8 | 45.2 | 100.0 | 43.5 | 43.4 |

- (a) Clients in receipt of services include all people who received one or more community service contacts or had one or more days of inpatient or residential care in the data period.
- (b) A new client is defined as a consumer who has not been seen in the five years preceding the first contact with a State or Territory specialised public mental health service in the data period.
- (c) See table 12A.33 and the DQI for specific footnotes regarding each State or Territory.
- (d) Analysis exclude data for clients for who the relevant demographic variable is missing (for example, Indigenous status).
- (e) Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider. State/territory is reported for the state/territory of the service provider.

⁽a) Rates are age-standardised to the Australian population as at 30 June 2001.

⁽b) Excludes people for whom Indigenous status was missing or not reported. The Indigenous status rates should be interpreted with caution due to the varying and, in some instances, unknown quality of Indigenous identification across jurisdictions.

⁽c) Caution should be taken when making inter-jurisdictional comparisons for public data. South Australia submitted data that were not based on unique patient identifier or data matching approaches. This was also the case for data submitted by Tasmania prior to 2012-13. Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. Industrial action during 2011-12 and 2012-13 in Tasmania has limited the available data quality and quantity of the community mental health care data; which represents a large proportion of the overall figures. Australian totals for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution. Australian totals for 2011-12 and 2012-13 should not be compared to previous years.

⁽d) Indigenous information is not collected for private psychiatric hospitals.

Table 12A.37 Proportion of people receiving clinical mental health services by service type and Indigenous status

NSW Vic Qld WA SA Tas ACT NT Aust

- (e) DVA data not available by Indigenous status. MBS data are not published for 2007-08. Medicare data presented by Indigenous status have been adjusted for under-identification in the Department of Human Services (DHS) Voluntary Indigenous Identifier (VII) database. Indigenous rates are therefore modelled and should be interpreted with caution. These statistics are not derived from the total Australian Indigenous population, but from those Aboriginal and Torres Strait Islander people who have voluntarily identified as Indigenous to DHS. The statistics have been adjusted to reflect demographic characteristics of the overall Indigenous population, but this adjustment may not address all the differences in the service use patterns of the enrolled population relative to the total Indigenous population. The level of VII enrolment (61 per cent nationally as at August 2012) varies across age-sex-remoteness-State/Territory sub-groups and over time which means that the extent of adjustment required varies across jurisdictions and over time. Indigenous rates should also be interpreted with caution due to small population numbers in some jurisdictions.
- (f) A change in scope for 'public data' implemented for the 2012-13 collection period means that comparison of rates for years up to and including 2011-12 with years 2012-13 and beyond should not be made. See data quality information for additional information.

| Very remote | 3.6 | •• | 2.2 | 1.6 | 3.3 | 5.3 | | 0.6 | 1.7 | 3 512 |

- (a) Not all remoteness areas are represented in each State or Territory. Where a state/territory does not have a particular remoteness category a rate cannot be calculated. Excludes contacts for which demographic information was missing and/or not reported.
- (b) Rates are age-standardised to the Australian population as at 30 June 2001.
- (c) For 2007-08 and 2008-09, disaggregation by remoteness area is based on a person's usual residence, the location of the service provider or a combination of both. For these years, the public data should be interpreted with caution as the methodology used to allocate remoteness area varied across jurisdictions. For 2009-10 data onwards, disaggregation by remoteness area is based on a person's usual residence, not the location of the service provider. State/territory is the state/territory of the service provider.
- (d) Caution should be taken when making inter-jurisdictional comparisons for public data. South Australian data are not based on unique patient identifier or data matching approaches. This was also the case for data submitted by Tasmania prior to 2012-13. Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. Industrial action during 2011-12 and 2012-13 in Tasmania has limited the available data quality and quantity of the community mental health care data; which represents a large proportion of the overall figures. Australian totals for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution. Australian totals for 2011-12 and 2012-13 should not be compared to previous years.
- (e) Private psychiatric hospital figures are not published for SA, Tasmania, and the ACT due to confidentiality reasons, but are included in the Australia figures.
- (f) Public 2012-13 data are considered a break in series due to a change of scope between 2011-12 and 2012-13. Historical remoteness area data was not resupplied due to this change in scope. Therefore, changes in public data from 2012-13 onwards with years prior to 2012-13 should not be made.

na Not available. .. Not applicable. – Nil or rounded to zero. **np** Not published.

- (a) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-economic Disadvantage, with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. SEIFA quintiles represent approximately 20 per cent of the national population, but do not necessarily represent 20 per cent of the population in each State or Territory. Excludes people for whom demographic information was missing and/or not reported.
- (b) Disaggregation by SEIFA is based on a person's usual residence, not the location of the service provider.
- (c) Rates are age-standardised to the Australian population as at 30 June 2001.
- (d) For 2007-08 and 2008-09, disaggregation by SEIFA is based on a person's usual residence, the location of the service provider or a combination of both. For these years, the public data should be interpreted with caution as the methodology used to allocate SEIFA varied across jurisdictions. From 2009-10 onwards, disaggregation by SEIFA is based on a person's usual residence, not the location of the service provider, except for public data for the NT, for which the majority of the data was based on the location of the service. Due to system-related issues impacting data quality, Tasmania was unable to provide data by SEIFA for 2008-09.
- (e) SA submitted data that were not based on unique patient identifier or data matching approaches. This was also the case for data submitted by Tasmania before 2012-13. Therefore caution should be taken when making inter-jurisdictional comparisons.
- (f) Private psychiatric hospital figures are not published for SA, Tasmania, and the ACT due to confidentiality reasons but are included in the Australia figures.
- (g) Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. Industrial action during 2011-12 and 2012-13 in Tasmania has limited the available data quality and quantity of the community mental health care data; which represents a large proportion of the overall figures. Australian totals for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution.
- (h) A change in scope for public data implemented for the 2012-13 collection period means that comparison of rates for years up to and including 2011-12 with years 2012-13 and beyond should not be made. See the quality statement for additional information.
 - **na** Not available. .. Not applicable. Nil or rounded to zero. **np** Not published.

Table 12A.41 Proportion of people receiving clinical mental health services, by service type and SEIFA IRSD deciles (age-standardised rate) (a), (b), (c)

Public (d) Private MBS and DVA

- (a) SEIFA deciles are based on the ABS Index of Relative Socio-economic Disadvantage (IRSD), with decile 1 being the most disadvantaged and decile 10 being the least disadvantaged. SEIFA deciles represent approximately 10 per cent of the national population, but do not necessarily represent 10 per cent of the population in each State or Territory. Excludes people for whom information was missing and/or not reported.
- (b) Disaggregation by SEIFA is based on a person's usual residence, not the location of the service provider, except for public data for the NT, for which around 89 per cent of the data was based on the location of the service.
- (c) Rates are age-standardised to the Australian population as at 30 June 2001.
- (d) For 2007-08 and 2008-09, disaggregation by SEIFA is based on a person's usual residence, the location of the service provider or a combination of both. For these years, the public data should be interpreted with caution as the methodology used to allocate SEIFA varied across jurisdictions. From 2009-10 onwards, disaggregation by SEIFA is based on a person's usual residence, not the location of the service provider. Due to system-related issues impacting data quality, Tasmania was unable to provide data by SEIFA for 2008-09. Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. Industrial action during 2011-12 and 2012-13 in Tasmania has limited the available data quality and quantity of the community mental health care data; which represents a large proportion of the overall figures. Australian totals for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution.
- (e) A change in scope for public data implemented for the 2012-13 collection period means that comparison of rates for years up to and including 2011-12 with years 2012-13 and beyond should not be made. See the quality statement for additional information.
 - Nil or rounded to zero.

⁽a) Rates are age-standardised to the Australian population as at 30 June 2001.

Table 12A.42 Proportion of people receiving clinical mental health services by service type (a)

Unit NSW Vic Qld WA SA Tas ACT NT Aust

- (b) Caution should be taken when making inter-jurisdictional comparisons for public data. South Australian data are not based on unique patient identifier or data matching approaches. This was also the case for data submitted by Tasmania prior to 2012-13. Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. Tasmania data for 2007-08 and 2008-09 are limited to Community mental health care services only and are therefore not comparable with later years. Industrial action during 2011-12 and 2012-13 in Tasmania has limited the available data quality and quantity of the community mental health care data; which represents a large proportion of the overall figures. Australian public totals and rates for 2011-12 and 2012-13 should be interpreted with caution as they include only available data and are therefore not comparable to previous years.
- (c) Private psychiatric hospital figures are not published for SA, Tasmania, and the ACT due to confidentiality reasons but are included in the Australia totals.
- (d) MBS and DVA services are those provided under any of the Medicare/DVA-funded service types described at (e) to (h). People seen by more than one provider type are counted only once in the total.
- (e) Consultant psychiatrist services are MBS items 134, 136, 138, 140, 142, 289, 291, 293, 296, 297, 299, 300, 302, 304, 306, 308, 310, 312, 314, 316, 318, 319, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338, 342, 344, 346, 348, 350, 352, 353, 355, 356, 357, 358, 359, 361, 364, 366, 367, 369, 370, 855, 857, 858, 861, 864, 866, 14224 (as relevant across years).
- (f) Clinical psychologist services are MBS items: 80000, 80005, 80010, 80015, 80020 and DVA items US01, US02, US03, US04, US05, US06, US07, US08, US50, US51, US99 (as relevant across years).
- (g) GP services are MBS items 170, 171, 172, 2574, 2575, 2577, 2578, 2700, 2701, 2702, 2704, 2705, 2707, 2708, 2710, 2712, 2713, 2715, 2717, 2719, 2721, 2723, 2725, 2727, 20104 (as relevant across years).
- (h) Other allied health services are MBS items 10956, 10968, 80100, 80105, 80110, 80115, 80120, 80125, 80130, 80135, 80140, 80145, 80150, 80155, 80160, 80165, 80170, 81325, 81355, 82000, 82015 and DVA items CL20, CL25, CL30, US11, US12, US13, US14, US15, US16, US17, US18, US21, US22, US23, US24, US25, US26, US27, US31, US32, US34, US35, US36, US37, US52, US53, US96, US97, US98 (as relevant across years).

⁽a) Totals do not equal the sum of all mental health providers as data excludes psychiatrists. MBS items included for this indicator are as follows:

⁻ Clinical psychologist services: MBS items 80000, 80005, 80010, 80015, 80020

⁻ GP services: MBS items 170, 171, 172, 2574, 2575, 2577, 2578, 2700, 2701,2702, 2704, 2705, 2707, 2708, 2710, 2712, 2713, 2715, 2717, 2719, 2721, 2723, 2725, 2727

⁻ Other allied health services: MBS items 10956, 10968, 80100, 80105, 80110, 80115, 80120, 80125, 80130, 80135, 80140, 80145, 80150, 80155, 80160, 80165, 80170, 81325, 81355, 82000, 82015.

⁽b) Data are based on the date the claim was processed.

⁽c) Age of the patient is based on age at last service during the reporting period. Note that in previous years, data supplied for this indicator calculated each patient's age at 30 June of each reference year. The derived rates may differ to those published in previous reports.

⁽d) A person is counted if any of the specified mental health item has been used in the reference period.

⁽e) A patient is allocated to a state/territory based on their location as at the last service in the reference period.

Table 12A.45 Young people who had contact with MBS subsidised primary mental health care services, by age group (a), (b), (c), (d), (e), (f), (g)

the discretization to the state or territory uses a concordance (ABS ASGS 2011 Postcode to Remoteness Area/State) and splits a person where the postcode

- (f) The allocation to the state or territory uses a concordance (ABS ASGS 2011 Postcode to Remoteness Area/State) and splits a person where the postcode covers more than one state/territory, therefore the totals may not equal the sum of the individual cells due to rounding.
- (g) The population data used in this table are the June estimate before the relevant financial year. For 2012-13 data, the estimate is June 2012. The derived rates may differ to those published in previous reports.
- (h) The sum of the states and territories may not add to the Australian totals as the Australian totals include young people who could not be allocated to a State or Territory.

- (a) Totals do not equal the sum of all mental health providers as data excludes psychiatrists. MBS items included for this indicator are as follows:
 - Clinical psychologist services: MBS items 80000, 80005, 80010, 80015, 80020
 - GP services: MBS items 170, 171, 172, 2574, 2575, 2577, 2578, 2700, 2701,2702, 2704, 2705, 2707, 2708, 2710, 2712, 2713, 2715, 2717, 2719, 2721, 2723, 2725, 2727
 - Other allied health services: MBS items 10956, 10968, 80100, 80105, 80110, 80115, 80120, 80125, 80130, 80135, 80140, 80145, 80150, 80155, 80160, 80165, 80170, 81325, 81355, 82000, 82015.
- (b) Data are based on the date the claim was processed.
- (c) Age of the patient is based on age at last service during the reporting period. Note that in previous years, data supplied for this indicator calculated each patient's age at 30 June of each reference year. The derived rates may differ to those published in previous reports.
- (d) A person is counted if any of the specified mental health item has been used in the reference period.
- (e) A patient is allocated to a state/territory based on their location as at the last service in the reference period.
- (f) The allocation to the state or territory uses a concordance (ABS ASGS 2011 Postcode to Remoteness Area/State) and splits a person where the postcode covers more than one state/territory, therefore the totals may not equal the sum of the individual cells due to rounding.
- (g) The derived rates may differ to those published in previous reports as they may be derived using updated populations.

Table 12A.46 Proportion of young people (aged < 25 years) who had contact with MBS subsidised primary mental health care services, by selected characteristics (per cent) (a), (b), (c), (d), (e), (f), (g)

NSW Vic Qld WA SA Tas ACT NT Aust (h)

- (h) The sum of the states and territories may not add to the Australian totals as the Australian totals include young people who could not be allocated to a State or Territory.
- (i) SEIFA quintile proportions are not available as the populations required to derive them are not available.

- (a) There is variation across jurisdictions in the method used to assign an assessment level (1, 2, 3 or 4) to service units. In some jurisdictions, if an organisation with multiple service units is assessed at a particular level all the expenditure on the organisation's units is 'counted' at that assessment level. In other jurisdictions, assessment levels are assigned at the service unit and this may or may not be consistent with the other units within the organisation. The approach can also vary across organisations within a single jurisdiction.
- (b) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.

Source: AIHW (unpublished) MHE NMDS.

⁻ Nil or rounded to zero.

- (a) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure estimates.
- (b) Due to the ongoing validation of the NMDS, data could differ from previous reports.
- (c) Recurrent expenditure exclude indirect and aged care residential expenditure.
- (d) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (e) Queensland does not fund community-based residential services, but funds extended treatment (campus-based and non-campus-based) services that provide longer term inpatient treatment and rehabilitation services with clinical staffing for 24 hours a day, 7 days a week.

⁽a) These data were prepared by the Australian Mental Health Outcomes and Classification Network, using data submitted by State and Territory governments to the Australian Government Department of Health. To be counted as an episode for which consumer outcome measures are collected, data need to be completed correctly (a specified minimum number of items completed) and have a 'matching pair' that is, a beginning and end rating are needed to enable an outcome score to be determined.

⁽b) Estimates of the number of episodes with complete outcome data for state and territory mental health services for all years are based on an analytic approach that compares the number of episodes with 'matched pairs' outcomes data to data submitted for the various mental health National Minimum Data Sets.

Table 12A.50 Specialised public mental health services episodes with completed consumer outcomes measures collected (a), (b)

Unit NSW Vic (c) Qld WA SA Tas (c) ACT NT Aust (c)

- (c) Data are not available for Victoria for 2011-12 and 2012-13. All totals for 2011-12 and 2012-13 exclude Victoria. Industrial action in Tasmania has limited the available data quality and quantity of the 2011-12 and 2012-13 data.
- (d) Group A covers people who received a discrete episode of inpatient care within a state/territory designated psychiatric inpatient unit during the reference year. The defining characteristic of the group is that the episode of inpatient care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission and discharge. The analysis excludes episodes where length of stay was three days or less because it is not meaningful to compare admission and discharge ratings for short duration episodes.
- (e) Group B covers people who received relatively short term community care from a state/territory mental health service during the reference year. The defining characteristic of the group is that the episode of community care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission to, and discharge from, community care. A subgroup of people whose episode of community care completed because they were admitted to hospital is not included in this analysis.
- (f) Group C covers people receiving relatively long term community care from a state/territory mental health service. It includes people who were receiving care for the whole of the reference year, and those who commenced community care sometime after 1 July who continued under care for the rest of the year. The defining characteristic of the group is that all remained in ongoing care when the year ended (30 June). Outcome scores were calculated as the difference between the total score recorded on the first occasion rated and the last occasion rated in the year.

- (a) Variation in jurisdictional legislation may result in differences in the definition of a seclusion event. Data reported by jurisdictions may therefore vary and comparisons should be made with caution.
- (b) NSW does not have a centralised database for the collection of seclusion data. Services report seclusion rates regularly to the NSW Ministry of Health. Services are required to maintain local seclusion registers, which may be audited by NSW Official Visitors. Seclusion rates are a Key Performance Indicator (KPI) in regular performance reporting to NSW Local Health Districts. NSW seclusion rates include bed days for some forensic services managed by correctional facilities.
- (c) Victoria has fewer beds per capita than other jurisdictions, and as such, it may be useful to view the rate of seclusion events in a broader population context (rates per capita).
- (d) Queensland and the NT do not report any acute forensic services, however forensic patients can and do access acute care through general units.
- (e) The WA data include seclusion events (numerator) and patient days (denominator) for both acute and non-acute specialised public mental health units. WA also does not have a centralised data base for the collection of seclusion data. Services provide seclusion data from their own data bases.
- (f) Recent data reporting improvements will impact on SA data. Bed days used to calculate SA's seclusion rates are estimated based on 100 per cent occupied bed numbers, which are fluctuating in relation to new infrastructure projects. The number of bed days is an estimate which affects the rate of seclusion reported for SA and fluctuations in bed numbers can relate to new infrastructure projects. During 2010-11, a substantial number of seclusion events in one particular hospital were for a small number of patients with over half of these patient-requested events. This may have impacted on the overall seclusion rate reported for the state for 2010-11.
- (g) For 2008-09, SA was unable to supply seclusion data.
- (h) The increase in the state-wide Tasmanian seclusion rate for 2012–13 and 2013–14 data is due to a small number of clients having an above average number of seclusion events.
- (i) For the ACT, when interpreting these data, the relative small size of the ACT should be noted, with a total of between 63 and 70 acute inpatient beds reported between 2008–09 and 2013–14.

Table 12A.51 Rate and duration of seclusion events in public specialised mental health acute inpatient units (a)

NSW (b) Vic (c) QId (d) WA (e) SA (f), (g) Tas (h) ACT (i), NT (d), (i), (k) (i), (m) Aust

- (j) ACT activities initiated as part of the Beacon Site project included the implementation of a clinical review committee inclusive of clinical staff, consumers and carer representation to review episodes of seclusion for systemic issues on a case-by-case basis. This has led to a number of reforms over several years that had a direct impact on the use of seclusion and its reduction to the low levels now reported.
- (k) In the ACT, work is progressive and ongoing as part of a larger process of providing a place of improved safety and security, both for people experiencing an acute episode of mental ill health leading to an inpatient admission, visitors and for the staff who work in this challenging environment.
- (I) Due to the low ratio of beds per person in the NT compared with other jurisdictions, the apparent rate of seclusion is inflated when reporting seclusion per patient day compared with reporting on a population basis. Due to the low number of beds in the NT, high rates of seclusion for a few individuals has a disproportional effect on the rate of seclusion reported. NT seclusion data is therefore not directly comparable with other jurisdictions.
- (m) The NT was unable to supply seclusion data for 2008-09.
- (n) SA report seclusion duration in 4 hour blocks and therefore the mean duration cannot be calculated. The national average seclusion duration figure excludes SA.
- (o) Due to data comparability issues for events occurring in forensic services, all forensic service events are excluded from the average duration analysis.

- (a) Non-government organisations are included only where they provide staffed residential services.
- (b) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of relevant items.
- (c) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (d) Data up to 2009-10 were restricted to consumer/carer consultants. In 2010-11, the definitions were altered to include a broader range of roles in the contemporary mental health environment, transitioning to mental health consumer and carer workers. These improved definitions should promote greater consistency between jurisdictions. Comparisons between data up to 2009-10 with data from 2010-11 should not be made.
- (e) NSW advised that the government has no authority to require consumer participation in services delivered through the primary care program.
- (f) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year.
- (g) WA has advised that this information does not represent the full range of consumer and carer participation. Genuine engagement with consumers and carers is one of the key principles of the Mental Health Commission's Strategic Policy document Mental Health 2020. The Commission has allocated funding to establish and support Consumers of Mental Health WA Inc., a peak body that provides systemic advocacy and is run for and by consumers. Other examples include provision of funding to develop the capacity of non-government organisations to employ people with a lived experience of mental illness and awarding scholarships to people with a lived experience to complete approved university and polytechnic studies in mental health. Several key consumer and carer advisory groups are supported and provided with financial assistance and collectively, these groups provide advice and representations on consumer and carer issues. The Commission funds Carers Association of WA for the provision of systemic advocacy services and the Mental Health Carers ARAFMI (WA) for a range of services including individual advocacy.
- (h) Consumer and carer workers are not employed in the ACT (except in 2005-06). The NT do not employ carer staff and employed consumer staff in 2012-13 only.
 - Nil or rounded to zero.

⁽a) For public sector community mental health services, Victorian data are unavailable for 2011-12 and 2012-13 due to service level collection gaps resulting from protected industrial action during this period.

- (b) SA submitted data that was not based on unique patient identifier but is based on a limited data matching approach. Therefore caution needs to be taken when making interjurisdictional comparisons.
- (c) Industrial action in Tasmania limited the available data quality and quantity of 2011-12 and 2012-13 community data. Tasmanian data are not available for 2005-06 and 2006-07. Data submitted up to 2012-13 were not based on unique patient identifiers or data matching approaches.
- (d) From 2012-13, the ACT has refined its calculation methodology and as such, comparisons to previous years' results should be viewed with caution.
- (e) Due to data supply issues, Australian totals should be interpreted with caution.na Not available.

⁽a) The Indigenous status rates should be interpreted with caution due to the varying and, in some instances, unknown quality of Indigenous identification across jurisdictions. Excludes people for whom demographic information was missing or not reported.

⁽b) Disaggregation by remoteness area is based on a person's usual residence, not the location of the service provider. State/territory is the state/territory of the service provider. Excludes people for whom demographic information was missing or not reported.

⁽a) Data are based on all 'in scope' separations from State and Territory psychiatric inpatient units, defined as those for which it is meaningful to examine readmission rates. The following separations were excluded: same day separations; overnight separations that occur through discharge/transfer to another hospital; statistical discharge — type change; left against medical advice/discharge at own risk and death.

Table 12A.57 Readmissions to hospital within 28 days of discharge (a), (b), (c), (d)

Unit NSW Vic Qld (e) WA SA (b) Tas (b) ACT NT Aust

- (b) For the purposes of this indicator, a readmission for any of the separations identified as 'in-scope' is defined as an admission to any other public psychiatric acute unit within the jurisdiction that occurs within 28 days of the date of the original separation. For this to occur a system of unique client identifiers needs to be in place that allows individuals to be 'tracked' across units. Such systems have been available in all states/territories for the full period (2005-06 to 2013-14), with the exception of Tasmania (which introduced such a system in 2012-13) and SA (which has not yet introduced such a system). Undercounting of readmissions may have occurred in SA and Tasmania in the years that the system of unique identifiers is not in place. For SA therefore only readmissions to same hospital are identified, in all years' data, rather than readmissions to any hospital.
- (c) No distinction is made between planned and unplanned readmissions because data collection systems in most Australian mental health services do not include a reliable and consistent method to distinguish a planned from an unplanned admission to hospital.
- (d) For data before 2012-13, states and territories differed in the overnight separations that they count as 'in scope'. NSW and Queensland excluded separations where length of stay is one night only and the procedure code for ECT is recorded and the ACT excluded all overnight separations with the procedure code for ECT, whereas the others (Victoria, WA, SA, Tasmania and the NT) include all overnight separations for the procedure code for ECT. For 2012-13, the exclusion of overnight stays of one night with an ECT procedure code became a business rule for the calculation of data for this indicator. The change was considered likely to be minimal, therefore, historical data updates were not considered mandatory. The change is also unlikely to alter the interpretability of long term data trends.
- (e) For Qld, inpatient identifiers are unique at a hospital level. A routine linkage program is utilised to create a unique identifier for reporting purposes.

- (c) No distinction is made between planned and unplanned readmissions because data collection systems in most Australian mental health services do not include a reliable and consistent method to distinguish a planned from an unplanned admission to hospital.
- (d) Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider. State/territory is reported for the state/territory of the service provider.
- (e) For Qld, inpatient identifiers are unique at a hospital level. A routine linkage program is utilised to create a unique identifier for reporting purposes.

⁽a) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).

⁽b) Depreciation is excluded for all years.

⁽c) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure items.

⁽d) Due to the ongoing validation of NMDS, data could differ from previous reports.

⁽e) Includes government expenditure and funded patients days in services managed and operated by private and non-government entities.

⁽f) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.

Table 12A.59 Average recurrent real costs per inpatient bed day, public hospitals, by target population (2013-14 dollars) (a), (b), (c), (d), (e)

- (g) Queensland Government has advised that it provides older people's mental health inpatient services using a number of different service models including campus and noncampus based options. All service types are reported as older people's mental health services, which may have the effect of lowering the average patient day costs compared to jurisdictions who report 'older people's care units' separately.
- (h) Data for a small number of Youth services have been rolled into the General services category at the request of Queensland Government.
- (i) For SA, any increases in admitted patient expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.
- (j) Child and adolescent mental health services were not available, or could not be separately identified, in Tasmania, the ACT and the NT. Older People's Mental Health Services programs were not available, or could not be separately identified, in Tasmania and the ACT for 2005-06, and the NT. Tasmanian figures include child and adolescent mental health services within the general mental health services category. Forensic mental health services were not provided separately in the ACT and in the NT from 2007-08.
- (k) ACT average costs for older person's mental health services are based on a new 20 bed unit opened in March 2007. During 2006-07, only 6–10 beds operated due to issues related to staffing resources. This has artificially inflated the average cost of older people's mental health services relative to other jurisdictions and other years.
 - .. Not applicable.

Source: AIHW (unpublished) MHE NMDS.

⁽a) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).

- (b) Depreciation is excluded for all years.
- (c) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure items.
- (d) Hospital inpatient expenditure can include expenditure on government funded public hospital services managed and operated by private and non government entities.
- (e) Mainstreaming has occurred at different rates across jurisdictions. Differences in costs can reflect differences in the rate of this institutional change (that is, the mainstreaming of mental health services).
- (f) Caution is required when interpreting NSW data. Seven residential mental health services in 2006-07 were reclassified as non-acute older person specialised hospital services in 2007-08, reflecting a change in function of those units.
- (g) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.

Table 12A.60 Average recurrent costs per inpatient bed day, public hospitals, by target population and care type (2013-14 dollars) (a), (b), (c), (d), (e)

NSW (f), (g) Vic (h) Qld (i), (j), (k) WA (l) SA (h), (m) Tas (h) ACT (h), (n) NT (h) Aust

- (h) Child and adolescent mental health services were not available, or could not be separately identified, in Tasmania, the ACT and the NT. Tasmanian figures include child and adolescent mental health services within the general mental health services category. Victoria and SA did not have non-acute child and adolescent mental health services units. Older People's Mental Health Services programs were not available, or could not be separately identified, in Tasmania and the NT. Older People's Mental Health Services in non-acute units were not available in Victoria and the ACT. Forensic mental health services were not provided separately in the ACT and in the NT from 2007-08.
- (i) Queensland Government has advised that it provides older people's mental health inpatient services using a number of different service models including campus and noncampus based options. All service types are reported as older people's mental health services, which may have the effect of lowering the average patient day costs compared to jurisdictions who report 'older people's care units' separately.
- (j) Caution is required when interpreting Queensland data. Several Forensic services reported in 2008-09 were reclassified as General services in 2009-10 to more accurately reflect the function of these services. Queensland does not report any acute forensic services; however, forensic patients can and do access acute care through general units, which may also impact on the comparability of both cost and length of stay data.
- (k) Data for a small number of hospital beds reported by Queensland as youth specialised mental health hospital beds are included in the General category at the request of Queensland Government.
- (I) Caution is required when interpreting WA data. A review of services resulted in the reclassification of beds between the acute and non-acute categories for the 2010-11 collection, to more accurately reflect the function of these services. In addition, during 2010-11, the child and adolescent non-acute inpatient service initiated the closure of beds in order to carry out a complete refurbishment. The service ceased operating in late 2011, but reopened in 2013-14.
- (m) For SA, any increases in admitted patient expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.
- (n) ACT average costs for older people's mental health services are based on a new 20 bed unit opened in March 2007. During 2006-07, only 6–10 beds operated due to issues related to staffing resources. This has artificially inflated the average cost of older people's mental health services relative to other jurisdictions and other years.
 - .. Not applicable.

⁽a) The quality of the separations data used to derive the results in this table is variable across jurisdictions. Until recently, these separations data were not subject to in depth scrutiny. It is expected that the quality of these data will improve over time.

Table 12A.61 Average length of stay, public hospitals acute units, by target population (no. of days) (a), (b)

NSW (c) Vic Qld (d) WA SA Tas (e) ACT (e) NT (e) Aust

- (b) There is a mismatch between the inpatient bed days and the separations used to derive this indicator for the relevant reference periods.
 - Patients days for clients who separated in the reference period (for example, 2012-13) that were during the previous period (2011-12) are excluded.
 - Patient days for clients who remain in hospital (that is, are not included in the separations data) are included.

The 'average length of stay' data reported here may not match data reported elsewhere (such as the Australian Institute of Health and Welfare's [AIHW's] Mental Health Services in Australia publication) due to differences in scope, for example these data include separations and days within the reference period only.

- (c) The quality of the NSW 2010-11 MHE NMDS data has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.
- (d) Separations for a small number of hospital beds reported by Queensland as youth specialised mental health hospital beds were included in the general category at the request of Queensland Government.
- (e) Child and adolescent mental health services were not available, or could not be separately identified, in Tasmania, the ACT and the NT. Tasmanian figures include child and adolescent mental health services within the general mental health services category. Older People's Mental Health Services programs were not available, or could not be separately identified, in Tasmania and the NT.
 - .. Not applicable.

| 2013-14 | 1 067.66 | 868.85 | 915.50 | 1 235.40 | 1 081.86 | 1 059.69 | 1 025.44 | 1 571.39 | 1 014.11 |

- (a) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).
- (b) Depreciation is excluded for all years.
- (c) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure items.
- (d) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (e) Hospital inpatient expenditure can include expenditure on government funded public hospital services managed and operated by private and non-government entities.
- (f) Mainstreaming has occurred at different rates across jurisdictions. The client profile and service costs can be very different for those of a jurisdiction in which general psychiatric treatment still occurs mostly in psychiatric hospitals. For example, Victorian data for psychiatric hospitals comprise mainly forensic services as nearly all general psychiatric treatment occurs in mainstreamed units in general acute hospitals.
- (g) Caution is required when interpreting NSW data. Seven residential mental health services in 2006-07 were reclassified as non-acute older person specialised hospital services in 2007-08, reflecting a change in function of those units.
- (h) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.
- (i) Mainstreaming has occurred at different rates in different jurisdictions. In Victoria's case, the data for psychiatric hospitals comprises mainly forensic services, since nearly all general psychiatric treatment occurs in mainstreamed units in general acute hospitals. This means that the client profile and service costs are very different from those of a jurisdiction where general psychiatric treatment still occurs mostly in psychiatric hospitals.

Table 12A.62 Average recurrent cost per inpatient bed day, by public hospital type (2013-14 dollars) (a), (b), (c), (d), (e), (f)

NSW (g), (h) Vic (i) Qld (j) WA (k) SA (l) Tas (m) ACT (m), (n) NT (m), (n) Aust

- (k) Caution is required when interpreting WA data. A review of services resulted in the reclassification of beds between the acute and non-acute categories for the 2010-11 collection, to more accurately reflect the function of these services.
- (I) For SA, any increases in admitted patient expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.
- (m) Tasmania, the ACT and the NT do not have public psychiatric hospitals.
- (n) SA, the ACT and the NT do not have non-acute units in public acute hospitals with a psychiatric unit or ward.
 - .. Not applicable.

Source: AIHW (unpublished) MHE NMDS.

⁽j) Queensland data for public acute hospitals include costs associated with extended treatment services (campus-based and non-campus-based) that report through general acute hospitals. Queensland does not provide acute services in psychiatric hospitals.

REPORT ON GOVERNMENT SERVICES 2016 MENTAL HEALTH MANAGEMENT PAGE **2** of TABLE 12A.63

Table 12A.63 Average recurrent cost per patient day for community residential services (2013-14 dollars) (a), (b), (c), (d), (e)

| I | NSW (f), (g), (h) | Vic (h) | Qld (i) | WA (j), (k), (h) | SA (k), (l) | <i>Tas</i> (m), (n) | ACT (h), (n) | NT (k), (l), (o) | Aust |
|---------------------------|-------------------|---------|---------|------------------|-------------|---------------------|--------------|------------------|--------|
| non-24-hour staffed units | | | | | | | | | |
| 2012-13 | | | | | | | | | |
| 24-hour staffed units | 243.01 | 376.33 | | | | 849.99 | 264.38 | | 391.98 |
| non-24-hour staffed units | | | | | | | | | |
| 2013-14 | | | | | | | | | |
| 24-hour staffed units | 271.47 | 387.81 | | | | 634.86 | 196.37 | | 397.86 |
| non-24-hour staffed units | | | | | | | | | |

- (a) Depreciation is excluded for all years.
- (b) Unit costs are not casemix adjusted.
- (c) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).
- (d) See AIHW *Mental Health Services in Australia* on-line publication (http://mhsa.aihw.gov.au/resources/expenditure/data-source/) for a full description of the derivation of expenditure items.
- (e) Due to the ongoing validation of the NMDS, data could differ from previous reports.
- (f) Caution is required when interpreting NSW data. Seven residential mental health services in 2006–07 were reclassified as non-acute older person specialised hospital services in 2007–08, reflecting a change in function of those units.
- (g) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.
- (h) A small number of residential beds reported by NSW and the ACT as child and adolescent residential mental health service beds were included in the general category at the request of these jurisdictions. Expenditure for a small number of residential beds reported by Victoria, WA and the ACT as youth specialised mental health residential beds were included in the general category at the request of these jurisdictions.
- (i) Queensland does not fund community residential services, however, it funds a number of extended treatment services, both campus and non-campus based, which provide longer term inpatient treatment and rehabilitation services with a full clinical staffing 24 hours a day 7 days a week. Queensland does not report these beds as community residential beds as it considers these beds to be substantially different to beds described as such in other states and territories.

Table 12A.63 Average recurrent cost per patient day for community residential services (2013-14 dollars) (a), (b), (c), (d), (e)

NSW (f), (g), (h) Vic (h) Qld (i) WA (j), (k), (h) SA (k), (l) Tas (m), (n) ACT (h), (n) NT (k), (l), (o) Aust

- (k) WA, SA and the NT do not have any community residential services that are aged care units.
- (I) A small number of residential services reported by SA in 2013-14, and the NT in 2012-13 and 2013-14, as forensic are included in the general category at the request of those jurisdictions.
- (m) Tasmanian services include both acute and rehabilitation units which have higher unit costs than extended care units.
- (n) Tasmania and the ACT do not have any community-based residential services that are non-24 hour staffed older people's units. From 2011-12, NSW did not have non-24 hour staffed older people's units.
- (o) General adult 24-hour residential services were not provided in the NT until 2007-08. From 2007-08, general non-24-hour staffed units are not provided.
 - .. Not applicable.

Source: AIHW (unpublished) MHE NMDS.

⁽j) Caution is required when interpreting WA data. Several residential services reported as 24-hour staffed services in 2009-10 transitioned to a non-24-hour staffed model of care as of 1 July 2010.

- (a) Non-uniquely identifiable consumers' have been excluded from the episodes of ambulatory care and treatment days data.
- (b) Recurrent expenditure data used to derive this measure have been adjusted (that is, reduced) to account for proportion of clients in the *CMHC NMDS* that were defined as 'non-uniquely identifiable consumers'. Therefore, it does not match recurrent expenditure on ambulatory care reported elsewhere.
- (c) Due to the ongoing validation of NMDS, data could differ from previous reports.
- (d) The quality of the NSW 2010-11 MHE NMDS data used for this Report has been affected by the reconfiguration of the service system during the year. For further details see the DQI for this indicator.
- (e) Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. The total only includes those jurisdictions that have provided data.
- (f) For SA, any increases in ambulatory expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.
- (g) Industrial action in Tasmania has limited the available data quality and quantity of the 2011-12 and 2012-13 data.
- (h) Time series financial data are adjusted to 2013-14 dollars using the State and Territory implicit price deflators for general government final consumption expenditure on hospital and nursing home services (table 12A.98).

- (a) Data on abstainers are in table 12A.69.
- (b) Results subject to RSEs of between 25 per cent and 50 per cent should be considered with caution and those with relative standard errors greater than 50 per cent should be considered as unreliable for most practical purposes. Estimates that have RSEs greater than 50 per cent are marked with " ** " and those with RSEs of between 25 per cent and 50 per cent are marked with " * ".
- (c) Never had more than 4 standard drinks on any occasion.
- (d) Had more than 4 standard drinks at least once a year but not as often as monthly.
- (e) Had more than 4 standard drinks at least once a month but not as often as weekly.
- (f) Had more than 4 standard drinks at least once a week but not as often as most days.
- (g) Had more than 4 standard drinks on most days or every day.

- (a) Recent use means used in the previous 12 months.
- (b) Results subject to RSEs of between 25 per cent and 50 per cent should be considered with caution and those with relative standard errors greater than 50 per cent should be considered as unreliable for most practical purposes. Estimates that have RSEs greater than 50 per cent are marked with " ** " and those with RSEs of between 25 per cent and 50 per cent are marked with " * ".
- (c) Respondents could select more than one condition in response to the question 'In the last 12 months have you been diagnosed or treated for...?'.
- (d) Includes heart disease and hypertension (high blood pressure).
- (e) Includes depression, anxiety disorder, schizophrenia, bipolar disorder, an eating disorder and other form of psychosis.

- (a) By year of registration. Year-to-year variation can be influenced by coronial workloads.
- (b) Suicide deaths include ICD-10 codes X60–X84 and Y87.0. Care needs to be taken in interpreting figures relating to suicide due to limitations of data.
- (c) Low population results in small variations in the number of suicides appearing as large changes across the single year rates.
- (d) Data for 2006 to 2011 have undergone revisions and are now considered final.
- (e) Data for 2012 have been revised and are subject to further revisions.
- (f) Data for 2013 are preliminary and subject to a revisions process.
- (g) Rate per 100 000 estimated resident population at 30 June of the relevant single year or for five year average the mid-point year (2009–2013). 2009–2013 rate includes final 2009, 2010 and 2011 data, revised 2012 data and preliminary 2013 data.
- (h) Death rates standardised to the mid-year 2001 population. The total death rate per 100 000 people for 2009–2013 does not match that in table 12A.81 as it reports the crude rate.
- (i) The ERPs used to derived these rates differ across years. For data up to 2005 the rates are derived using ERPs based on the 2001 Census. For data from 2006 the rates are derived using ERPs based on the 2006 Census. For data from 2009 (and for the five year averages 2009–2013) the rates are derived using the ERPs based on the 2011 Census. Rates derived using ERPs based on different Censuses are not comparable.

- (a) By year of registration. Year-to-year variation can be influenced by coronial workloads.
- (b) Suicide deaths include ICD-10 codes X60–X84 and Y87.0. Care needs to be taken in interpreting data relating to suicide. See ABS Causes of Death, 2013 (Cat. no. 3303.0) Explanatory Notes 87–93.
- (c) From 2006 data onwards, data cells with small values have been randomly assigned to protect the confidentiality of individuals. As a result, some totals will not equal the sum of their components. Rates use the actual count and not the randomly assigned value. Cells with a zero value have not been affected by confidentialisation.
- (d) All footnotes and caveats, including this notice, must remain attached to data at all times.
- (e) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Revised data for this year's report are: 2011 (final), 2012 (revised) and the data for 2013 are preliminary. See Explanatory Notes 52–54 and Technical Note, Causes of Death Revisions 2011 and 2012 in *Causes of Death, Australia, 2013* (Cat. no. 3303.0).
- (f) Low population results in small variations in the number of suicides appearing as large changes across the single year rates.
- (g) Includes 'Other Territories'.

Table 12A.83 Suicide deaths and death rate of people aged 15-24 years (a), (b), (c), (d), (e)

| Total | 9.1 | 9.4 | 13.3 | 13.4 | 11.9 | 14.0 | 9.1 | 17.6 | 10.9 |

- (a) Suicide deaths include ICD-10 codes X60–X84 and Y87.0. Care needs to be taken in interpreting data relating to suicide. See *ABS Causes of Death*, *2013* (Cat. no. 3303.0) Explanatory Notes 87–93.
- (b) The total for each state and territory includes deaths registered to that state but which had a usual address which was undefined, overseas, of no fixed abode or off-shore and migratory. Such 'special purpose' Statistical Area 2s are only included in the state total.
- (c) The Australian total includes the 'Other Territories' Jervis Bay, Christmas Island and the Cocos (Keeling) Islands.
- (d) For single year data prior to 2006, the categories were as follows: 'capital city' comprises capital city statistical divisions; 'other urban' comprises centres with more than 20 000 people; 'rural' comprises all areas except capital cities and other urban. 'Other urban' comprises statistical local areas with 50 per cent or greater of their 2001 census enumerated population contained in urban centres, based on Australian Standard Geographical Classification (ASGC) 2001 boundaries. 'Rural' comprises statistical local areas with 50 per cent or greater of their 2001 census enumerated population contained in rural areas. Changes in the population within geographical areas may not be reflected in the rates provided. There is some risk that urban growth areas have been classified as rural as the geography was based on the population in those areas in 2001. Therefore, analysis of data should be undertaken with caution.

Table 12A.84 Suicide deaths and suicide death rate, by area (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)

NSW Vic Qld WA SA Tas (k) ACT NT Aust (c)

- (e) For single year 2006, 2007 and 2008, the categories were derived as follows: 'capital cities' comprising capital city statistical divisions, 'urban centres' based on 'statistical districts' that are urban centres with population >25 000 people, excluding capital city statistical divisions, (three statistical districts cross state boundaries and have to be split across the relevant states/territories Albury–Wodonga, Canberra–Queanbeyan and Gold Coast–Tweed); 'rural' balance of state, that is all areas other than capital cities and urban centres.
- (f) For the single years from 2009 and the five year sum and averages (2009–2013), the capital city, urban centres and rural groupings are based on the ABS' Significant Urban Areas classification (Cat. no. 1270.0.55.004). Capital cities are comprised of those Statistical Area 2s classified as capital cities. Urban centres are comprised of all Statistical Area 2s within a state which are classified as having or contributing to an urban area with a population of 10 000 or greater, excluding capital cities. Rural areas are those Statistical Area 2s which are not within a capital city or urban centre. For further information, see Cat. no. 1270.0.55.004 Australian Statistical Geography Standard (ASGS): Volume 4 Significant Urban Areas, Urban Centres and Localities, Section of State, July 2011. Some Significant Urban Areas cross state boundaries: Canberra Queanbeyan (ACT/NSW); Albury Wodonga (NSW/Vic); and Gold Coast Tweed Heads (Qld/NSW). In these cases, deaths have been included in the Urban Centre category in the relevant state. The exception is Canberra Queanbeyan: the Canberra portion forms the Capital City area for ACT, while the Queanbeyan portion has been included in the Urban Centres data for NSW.
- (g) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Revised data for this year's report are: 2011 (final), 2012 (revised) and the data for 2013 are preliminary.
- (h) For data from 2006, cells with small values have been randomly assigned to protect the confidentiality of individuals. As a result, some totals will not equal the sum of their components. Cells with a zero value have not been affected by confidentialisation.
- (i) All footnotes and caveats, including this notice, must remain attached to data at all times.
- (j) The total for each state and territory includes deaths registered to that state, but which had a usual address which was undefined, overseas, of no fixed abode or off-shore and migratory. Such 'special purpose' Statistical Area 2s are only included in the state total.
- (k) The three criteria for this data tend to distort the Tasmanian picture due to the low level of urbanisation.
- (I) Age-standardised death rates per 100 000 are standardised to Australian 30 June 2001 population. Rates for 2009–2013 and 2013 are based on 2013 revised substate estimated resident population data.
 - .. Not applicable. Nil or rounded to zero. np Not published.

- (a) All causes of death data from 2006 onward are subject to a revisions process once data for a reference year are 'final', they are no longer revised. Revised data for this year's report are: 2011 (final), 2012 (revised) and the data for 2013 are preliminary. See Explanatory Notes 52–54 and Technical Note, Causes of Death Revisions 2011 and 2012 in Causes of Death, Australia, 2013 (Cat. no. 3303.0). See also Explanatory Notes 70–95 for further information on specific issues relating to 2013 data.
- (b) Data are based on State or Territory of usual residence.
- (c) Suicide deaths include ICD-10 codes X60–X84 and Y87.0. Care needs to be taken in interpreting data relating to suicide. See ABS Causes of Death, 2013 (Cat. no. 3303.0) Explanatory Notes 87–93.
- (d) Data are presented in a five-year aggregation (2009–2013) due to volatility of the small numbers involved.
- (e) All footnotes and caveats, including this notice, must remain attached to data at all times.
- (f) Data are reported for NSW, Qld, WA, SA and the NT only. Only these five states and territories have evidence of a sufficient level of Indigenous identification and sufficient numbers of Indigenous deaths to support mortality analysis. See Explanatory Notes 58–67 for further information on interpreting data relating to deaths of Indigenous persons.
- (g) Deaths where the Indigenous status of the deceased was not stated are included with the non-Indigenous data.
- (h) Care should be taken when interpreting deaths data for Queensland as they were affected by changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 were adjusted to minimise the impact of late registration of deaths on mortality indicators. See Retrospective deaths by Causes of Death, Queensland, 2010 (Technical Note) in Causes of Death, Australia, 2010 (Cat. no. 3303.0) for a more detailed explanation.
- (i) Total includes data for NSW, Queensland, WA, SA and the NT only.
- (j) Age standardised death rates. Deaths are per 100 000 of estimated mid-year population. The current ABS standard population is all persons in the Australian population at 30 June 2001. See Glossary of *Causes of Death, Australia, 2013* (Cat. no. 3303.0) for further information.
- (k) The Aboriginal and Torres Strait Islander population denominator used for calculating death rates in this table is from Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (Cat. no. 3238.0), Series B. These are 2011-census-based population projections. The non-Indigenous denominator has been derived by subtracting the Indigenous population projections from the total persons 2011-census-based population estimates.

⁽a) The rates reported in this table include 95 per cent confidence intervals (for example, X per cent $\pm X$ per cent).

⁽b) Numerators — number of adults (aged 18 years or over) who are overweight or obese or a daily smoker or at risk of long term harm from alcohol (by mental health status). Denominators — number of adults (aged 18 years or over) in the population (by mental health status).

⁽c) As State and Territory comparisons are affected by age, estimates have been age standardised to the 2001 estimated resident population.

⁽d) Data for NT should be interpreted with caution as the *Australian Health Survey (2011-12 NHS component)* excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

⁽e) People with a mental or behavioural condition are defined as having a current self-reported mental and behavioural problem that has lasted for six months, or which the respondent expects to last for six months or more.

Table 12A.86 Age-standardised proportions of adults by health risk factors and mental illness status, 2011-12 (a), (b), (c)

NSW Vic Qld WA SA Tas ACT NT (d) Total

⁽f) Includes organic mental conditions, alcohol and drug conditions, mood conditions and other mental and behavioural conditions.

⁽g) 'At risk of long term harm' is based on the 2009 National Health and Medical Research Council (NHMRC) guidelines.

Table 12A.88 Age-standardised proportion of people aged 16–64 years who are employed, by mental illness status, 2011-12 (per cent) (a), (b), (c)

NSW Vic Qld WA SA Tas ACT NT (d) Total

- (a) The rates reported in this table include 95 per cent confidence intervals (for example, X per cent ± X per cent). A '*' indicates a RSE of between 25 per cent and 50 per cent. Estimates with RSEs greater than 25 per cent should be used with caution. A '**' indicates a RSE of greater than 50 per cent. Estimates with RSEs greater than 50 per cent are considered too unreliable for general use.
- (b) Numerators number of people aged 16–64 years who are employed/unemployed/in the labour force/not in the labour force (by mental health status).

 Denominators number of people aged 16–64 years in the population (by mental health status).
- (c) As State and Territory comparisons are affected by age, estimates have been age standardised to the 2001 estimated resident population.
- (d) Data for NT should be interpreted with caution as the *Australian Health Survey (2011-12 NHS component)* excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.
- (e) People with a mental or behavioural condition are defined as having a current self-reported mental and behavioural problem that has lasted for six months, or which the respondent expects to last for six months or more.
- (f) Includes organic mental conditions, alcohol and drug conditions, mood conditions and other mental and behavioural conditions.

Table 12A.89 Age-standardised proportion of the population aged 16-30 years who are employed and/or are enrolled for study in a formal secondary or tertiary qualification (full or part-time), by mental health status, 2011-12 (per cent) (a), (b), (c)

- (a) People with a mental illness is a self-reported data item. The data item refers to clinically recognised emotional and behavioural disorders, and perceived mental health problems such as feeling depressed, feeling anxious, stress and sadness.
- (b) People who had face-to-face contact with family or friends living outside the household in the last week refers to those who reported having contact everyday or at least weekly.
- (c) The rates reported in this table include 95 per cent confidence intervals (for example, X per cent \pm X per cent).
- (d) Cells in this table may have been randomly adjusted to avoid the release of confidential data.
- (e) Data for NT should be interpreted with caution as the *General Social Survey 2014* excluded discrete Aboriginal and Torres Strait Islander communities and very remote areas, which comprise around 25 per cent of the estimated resident population of the NT.

- (a) These data were prepared by the Australian Mental Health Outcomes and Classification Network, using data submitted by State and Territory governments to the Australian Government Department of Health. Assessment of clinical outcomes is based on the changes reported in a consumer's score on a rating scale known as the Health of the Nation Outcomes Scale (HoNOS), or in the case of children and adolescent consumers, the Health of the Nation Outcome Scales for Children and Adolescents (HoNOSCA). Developed originally in England in the 1990s, these ratings scales comprise standard items that are rated by a clinician to measure the severity of the consumer's symptoms or disability across a range of domains (for example, depressed mood, hallucinations, substance use, suicidality, overactivity, activities of daily living, cognitive impairment). The HoNOS/HoNOSCA form part of small suite of standardised rating scales used to monitor outcomes across state and territory public sector mental health services and private hospitals with a specialised psychiatric unit. To be considered valid, HoNOS, or the HoNOSCA data needs to be completed correctly (a specified minimum number of items completed) and have a "matching pair" that is, a beginning and end rating are needed to enable an outcome score to be determined.
- (b) Proportions may not add to 100 per cent due to rounding.
- (c) For all consumer groups, outcome scores for each episode are classified as either 'significant improvement', 'significant deterioration or 'no significant change', based on Effect Size. Effect size is a statistic used to assess the magnitude of a treatment effect. It is based on the ratio of the difference between pre- and post- scores to the standard deviation of the pre- score. As a rule of thumb, effect sizes of 0.2 are considered small, 0.5 considered medium and 0.8 considered large. Based on this rule, a medium effect size of 0.5 was used to assign outcome scores to the three outcome categories. Thus individual episodes were classified as either: 'significant improvement' if the Effect Size index was greater than or equal to positive 0.5; 'significant deterioration' if the Effect Size index was less than or equal to negative 0.5; or 'no change' if the index was between -0.5 and 0.5.
- (d) Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. All national averages for 2011-12 and 2012-13 exclude Victoria.
- (e) Industrial action in Tasmania has limited the available data quality and quantity of data for 2011-12 and 2012-13.

Table 12A.96 Clinical outcomes of people receiving various types of mental health care provided by State and Territory public mental health services (per cent) (a), (b), (c)

NSW Vic (d) Qld WA SA Tas (e) ACT (f) NT (f) Aust (d)

- (f) Some data for the ACT and the NT are np (not published) due to insufficient observations. The number of observations of consumer outcomes for some care types is too low to publish because conclusions based on such low numbers are known to have high levels of unreliability. For the purposes of this indicator, the threshold for the minimum number of observations to be reached was set at 200.
- (g) Group A covers people who received a discrete episode of inpatient care within a state/territory designated psychiatric inpatient unit during the reference year. The defining characteristic of the group is that the episode of inpatient care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission and discharge. The analysis excludes episodes where length of stay was three days or less because it is not meaningful to compare admission and discharge ratings for short duration episodes.
- (h) Group B covers people who received relatively short term community care from a state/territory mental health service during the reference year. The defining characteristic of the group is that the episode of community care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission to, and discharge from, community care. A subgroup of people whose episode of community care completed because they were admitted to hospital is not included in this analysis.
- (i) Group C covers people receiving relatively long term community care from a state/territory mental health service. It includes people who were receiving care for the whole of the reference year, and those who commenced community care sometime after 1 July who continued under care for the rest of the year. The defining characteristic of the group is that all remained in ongoing care when the year ended (30 June). Outcome scores were calculated as the difference between the total score recorded on the first occasion rated and the last occasion rated in the year.

- (a) These data were prepared by the Australian Mental Health Outcomes and Classification Network, using data submitted by State and Territory governments to the Australian Government Department of Health. Assessment of clinical outcomes is based on the changes reported in a consumer's score on a rating scale known as the Health of the Nation Outcomes Scale (HoNOS), or in the case of children and adolescent consumers, the Health of the Nation Outcome Scales for Children and Adolescents (HoNOSCA). Developed originally in England in the 1990s, these ratings scales comprise standard items that are rated by a clinician to measure the severity of the consumer's symptoms or disability across a range of domains (for example, depressed mood, hallucinations, substance use, suicidality, overactivity, activities of daily living, cognitive impairment). The HoNOS/HoNOSCA form part of small suite of standardised rating scales used to monitor outcomes across state and territory public sector mental health services and private hospitals with a specialised psychiatric unit. To be considered valid, HoNOS, or the HoNOSCA data needs to be completed correctly (a specified minimum number of items completed) and have a "matching pair" that is, a beginning and end rating are needed to enable an outcome score to be determined.
- (b) Proportions may not add to 100 per cent due to rounding.
- (c) For all consumer groups, outcome scores for each episode are classified as either 'significant improvement', 'significant deterioration or 'no significant change', based on Effect Size. Effect size is a statistic used to assess the magnitude of a treatment effect. It is based on the ratio of the difference between pre- and post- scores to the standard deviation of the pre- score. As a rule of thumb, effect sizes of 0.2 are considered small, 0.5 considered medium and 0.8 considered large. Based on this rule, a medium effect size of 0.5 was used to assign outcome scores to the three outcome categories. Thus individual episodes were classified as either: 'significant improvement' if the Effect Size index was greater than or equal to positive 0.5; 'significant deterioration' if the Effect Size index was less than or equal to negative 0.5; or 'no change' if the index was between -0.5 and 0.5.
- (d) Victorian 2011-12 and 2012-13 data are unavailable due to service level collection gaps resulting from protected industrial action during this period. All national averages for 2011-12 and 2012-13 exclude Victoria.

Table 12A.97 People who received mental health care provided by State and Territory public mental health services and who significantly improved, by service type and age group (per cent) (a), (b), (c)

NSW Vic (d) Qld WA SA Tas (e) ACT (f) NT (f) Aust (d)

- (e) Industrial action in Tasmania has limited the available data quality and quantity of data for 2011-12.
- (f) Some data for the ACT and the NT are np (not published) due to insufficient observations. The number of observations of consumer outcomes for some care types is too low to publish because conclusions based on such low numbers are known to have high levels of unreliability. For the purposes of this indicator, the threshold for the minimum number of observations to be reached was set at 200.
- (g) Group A covers people who received a discrete episode of inpatient care within a state/territory designated psychiatric inpatient unit during the reference year. The defining characteristic of the group is that the episode of inpatient care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission and discharge. The analysis excludes episodes where length of stay was three days or less because it is not meaningful to compare admission and discharge ratings for short duration episodes.
- (h) Group B covers people who received relatively short term community care from a state/territory mental health service during the reference year. The defining characteristic of the group is that the episode of community care commenced, and was completed, within the year. Outcome scores were calculated as the difference between the total score recorded at admission to, and discharge from, community care. A subgroup of people whose episode of community care completed because they were admitted to hospital is not included in this analysis.
- (i) Group C covers people receiving relatively long term community care from a state/territory mental health service. It includes people who were receiving care for the whole of the reference year, and those who commenced community care sometime after 1 July who continued under care for the rest of the year. The defining characteristic of the group is that all remained in ongoing care when the year ended (30 June). Outcome scores were calculated as the difference between the total score recorded on the first occasion rated and the last occasion rated in the year.

Data quality information — Mental health management, chapter 12

Data Quality Information

Data quality information (DQI) provides information against the seven Australian Bureau of Statistics (ABS) data quality framework dimensions, for a selection of performance indicators in the Mental health management chapter. DQI for additional indicators will be progressively introduced in future reports.

Technical DQI has been supplied or agreed by relevant data providers. Additional Steering Committee commentary does not necessarily reflect the views of data providers.

DQI Contents

| New client index | 3 |

New client index

DQI for this indicator has been sourced from the Australian Institute of Health and Welfare (AIHW) and State and Territory health authorities with additional Steering Committee comments.

Indicator definition and description

Element Equity — access

Indicator New client index — State or Territory specialised public mental health services

Measure <u>Description:</u>

(computation) Proportion of total clients under the care of State or Territory specialised public mental

health services who were new clients. A new client is a consumer who has not been seen by a specialised public mental health service in the five years preceding the initial

contact with a service in the relevant reference period.

Numerator:

Number of new clients — clients who had not been seen by a public mental health service in the five years preceding the initial contact with a service in the relevant

reference period.

Number of total clients under the care of State or Territory specialised public mental

health services in the relevant reference period.

Computation:

Denominator:

Expressed as a proportion: (Numerator ÷ Denominator)*100.

Data source/s The AIHW using data provided by State and Territory governments from the community

mental health care (CMHC), residential mental health and admitted patients mental

health collections.

Data Quality Framework Dimensions

Institutional environment

The AIHW calculated the indicator based on data supplied by state and territory health authorities.

The State and Territory health authorities provide these data according to specifications agreed under the *National Key Performance Indicators for Australian Public Mental Health Services*. State and Territory health authorities receive these data from specialised mental health organisations/units in psychiatric and acute hospitals, community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

Estimates are based on all 'in-scope' clients (new and total) who are in receipt of services from state and territory public psychiatric inpatient units, residential units and community mental health services. New clients are those who have not been seen by a public specialised mental health service in the five years preceding the initial contact with a service in the relevant reference period. A consumer is not considered to be 'new' client if they present with a new condition, but have previously received treatment for other conditions.

Data for all years reflect full financial year activity — that is, all in scope clients from public specialised mental health services between the period 1 July and 30 June for each financial year.

Only state and territory specialised public mental health services are included. New clients may have been treated in the preceding five years outside the state/territory specialised public mental health system in the primary mental health care or the specialist private mental health sector.

States and territories vary in their capacity to accurately track clients across organisations, due to the lack of unique patient identifiers or data matching systems. SA

indicated that the data submitted were not based on unique patient identifier or data matching approaches.

Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider. State/territory is reported for the state/territory of the service provider. NSW has used postcode based remoteness and SEIFA correspondence files, rather than SA2 concordance tables for these groups.

For NSW, residential clients are not included because their data is manually collected without a Statewide Unique Patient Identifier (SUPI) assigned, thus making the unique counts of the residential clients together with the inpatient and ambulatory clients not possible.

Data are not available for Victoria for 2011-12 or 2012-13. All Australian totals for 2011-12 and 2012-13 exclude Victoria.

All states except Victoria count triage and referral patients, that is those who are assessed and referred on.

Industrial action in Tasmania in 2011-12 and 2012-13 has limited the quality and quantity of community data.

Timeliness

State and Territory governments provide data to the AIHW for national collation, approximately twelve months after the reference period. The reference period for the latest data is 2013-14.

Accuracy

State and Territory governments are primarily responsible for the quality of the data they provide. The AIHW analyses the data, but cannot independently verify them.

Data are subject to ongoing historical validation. Due to this ongoing validation, 2009-10 and 2012-13 data might differ from previous reports.

States and territories differ in their capacity to accurately track clients across organisations or service types, due to the lack of unique patient identifiers or data matching systems. This has led to over/undercounting of clients in some jurisdictions.

- NSW has implemented a SUPI for mental health care. The identification of prior contacts for mental health clients is dependent upon the SUPI, both in coverage (all clients having a SUPI) and in the resolution of possible duplicates. There are differences in the completeness of coverage between the Local Health Districts/Networks and over time. The average SUPI coverage at a State level is 99.9 per cent for 2012-13. The numbers provided are a distinct count of individuals using the SUPI (majority) and a count of individuals at the facility level for a small percentage of clients without a SUPI in the reporting period (which may include some duplicates of those who attended multiple facilities).
- For NSW, residential clients are not included because their data is manually collected without SUPI assigned, thus making the unique counts of the residential clients together with the inpatient and ambulatory clients not possible. The client base of the NSW mental health residential is very small which will have minimal effect on the final result (for example, there were 237 total residential MH clients with 131 potential new clients in 2012-13).
- For Qld, unique client counts are identified through a statistical linkage process rather than a unique client record. Prior to 2009-10, person count was based on linkage of multiple databases for ambulatory mental health services, and the single inpatient database. From 2009-10 onwards, a single statewide system was introduced for ambulatory mental health services, and the unique identifier is used from this system. However, data are linked through a linkage process based on deterministic and probabilistic methods rather than use of a system level unique identifier.
- For WA, the matching of mental health community contacts to inpatient episodes from 2012-13 is done between two separate data systems and requires the use of record linkage to be able to identify the same person in both systems. There are delays associated in the use of record linkage and these delays can result in not getting a match between a community contact and a separation when there should be one. The number of unique consumers (both total and new) could be over-estimated as a result. Data before 2012-13 are based on data submitted for the National Minimum Data Set (NMDS) and have not been revised.
- · For SA, the client counts are not unique: they are an aggregation of three

separate databases with no linkage between them. The impact on the result should be minimal due to populations being relatively stable within the three respective catchments.

For Tasmania, information for years before 2012-13 were extracted from three different data sources and linked together with a Statistical Linkage Key (SLK) for each individual present in the extracts for the reporting period. While every attempt has been made to reduce any duplication of identified clients, using an SLK will lead to some duplication and can wrongly identify clients as new clients. Tasmania has been progressively implementing a state-wide patient identification system. Data for 2012-13 is considered to be the first collection period with this system fully implemented.

Coherence

Data are reported for each year from 2009-10 to 2013-14. There has been no major change to the methodology used to collect the data across years except as outlined below for WA.

The Australian totals for 2011-12 and 2012-13 exclude Victoria and are not comparable to other years.

Jurisdictions can differ in their approaches to counting clients under care. For example, people who are assessed for a mental health service but do not go on to be treated for a mental illness are included in the data by some jurisdictions but not others. Therefore, comparisons between jurisdictions should be made with caution.

States and territories differ in their capacity to accurately track clients across organisations or service types, this can affect the comparability of the results across jurisdictions (see the accuracy dimension).

For WA, data before 2012-13 are based on data submitted for the NMDS and have not been revised.

Accessibility

Data are also available for this indicator in the:

- National mental health reports www.health.gov.au/internet/main/ publishing.nsf/Content/mental-data
- Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Interpretability

Information for understanding this indicator is available:

- the Key Performance Indicators for Australian Public Mental Health Services, Second Edition at www.health.gov.au/internet/mhsc/publishing.nsf /Content/99A25CC5B3781660CA257A5D000235B3/\$File/kpitech.pdf
- in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition
- from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- States and territories vary in their capacity to accurately track clients across organisations, due to the lack of unique patient identifiers or data matching systems.
- Data are not available for Victoria for 2011-12 or 2012-13. All Australian totals for 2011-12 or 2012-13 exclude Victoria.
- Industrial action in Tasmania in 2011-12 and 2012-13 has limited the available data quality and quantity of community data.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Mental health service use by special needs groups and total population

DQI for this indicator has been sourced from the AIHW for the National Healthcare Agreement with additional Steering Committee comments.

Indicator definition and description

Elements Equity — Access and Effectiveness — Access

Indicators Mental health service use by special needs groups

Mental health service use by total population

Measure (computation)

The *numerator* is the number of people receiving mental health services, separately

for three service types.

The denominator is the Estimated Resident Population (ERP) as at 30 June.

Calculation is 100 × (Numerator ÷ Denominator), presented as a percentage and age-standardised to the Australian population as at 30 June 2001, using 5-year age groups to 84 years with ages over 84 years combined. Aboriginal and Torres Strait Islander population data are not available for all data sources for 5-year age groups beyond 64 years. Where data were not available, Aboriginal and Torres Strait Islander disaggregations were standardised to 64 years with ages over 64 years combined.

These are calculated separately for public, private, Medicare Benefits Scheme- and Department of Veterans' Affairs (DVA)-funded services.

Data source/s

Numerators:

For Public data: State/Territory data, including admitted specialised mental health hospital, residential mental health care and CMHC services.

For Private data: Private Mental Health Alliance (PMHA) Centralised Data Management Service (CDMS) data.

For MBS data: Australian Government Department of Health (Health) MBS Statistics.

For DVA data: Australian Government DVA Statistical Services and Nominal Rolls using the Departmental Management Information System (DMIS). These data are known as Treatment Account System (TAS) data.

Denominator:

ABS ERP as at 30 June.

ABS Aboriginal and Torres Strait Islander Estimates and Projections Series B.

Data Quality Framework Dimensions

Institutional environment

The AIHW prepared the denominator and calculated the indicator based on numerators supplied by other data providers. The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

Numerators for this indicator were prepared by State and Territory health authorities, the PMHA, Health and DVA and quality-assessed by the AlHW.

The AIHW drafted the initial data quality statement. The statement was finalised by AIHW following input from State and Territory health authorities, PMHA, Health and DVA. The AIHW does not hold the relevant mandated datasets required to independently verify the data tables for this indicator.

Public data

The State and Territory health authorities receive these data from public sector specialised mental health services. States and territories use these data for service

planning, monitoring and internal and public reporting.

Private data

The PMHA's CDMS provided data submitted by private hospitals with psychiatric beds. The data are used by hospitals for activities such as quality improvement.

Health MBS and DVA TAS data

The Department of Human Services (DHS) processes claims made under the *Medicare Australia Act 1973*. These data are then regularly provided to Health. DHS also processes claims for DVA Treatment Card holders made through the MBS under the *Veterans' Entitlements Act 1986; Military Rehabilitation and Compensation Act 2004* and *Medicare Australia Act 1973*. All claiming data is regularly provided to DVA as per the Memorandum of Understanding between DHS and DVA.

Relevance

Estimates are based on counts of individuals receiving care within the year, by each service type, where each individual is generally counted once regardless of the number of services received. Persons can receive services of more than one type within the year; a count of persons receiving services regardless of type is not available.

Persons receiving mental health treatment who are not captured in these data sources include individuals receiving mental health services (other than as admitted patients in private hospitals) funded through other third party funders (e.g. transport accident insurers, workers compensation insurers) or out of pocket sources.

There is likely to be considerable overlap between the various data sources since it is likely that patients accessing public services and private hospital services would also access MBS services.

Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider. State/territory is reported for the state/territory of the service provider.

Public data

Person counts for State and Territory mental health services are counts of persons receiving one or more service contacts provided by public sector specialised mental health services, including admitted hospital, community and residential services.

Private data

Private hospital estimates are counts of individuals receiving admitted patient specialist psychiatric care in private hospitals.

Health MBS and DVA TAS data

Data are counts of individuals receiving mental health-specific MBS services for which Department of Human Services (DHS) has processed a claim.

Analyses by state/territory, remoteness and socioeconomic status are based on postcode of residence of the client as recorded by DHS at the date of last service processed in the reference period. As clients may receive services in locations other than where they live, these data do not necessarily reflect the location in which services were received.

DVA clients comprised of people receiving Australian Government (Medicare Benefits Scheme- and DVA-funded) clinical mental health services.

Timeliness

The reference periods for these data are 2007-08, 2008-09, 2009-10, 2010-11, 2011-12, 2012-13 and 2013-14.

Accuracy

Cells have been suppressed to protect confidentiality (where the presentation could identify a patient or a single service provider).

Public data

State and Territory jurisdictions differ in their capacity to provide accurate estimates of person receiving services. Additionally, jurisdictions differ in their approaches to counting clients under care. For example, people who are assessed for a mental health service but do not go on to be treated for a mental illness are included in the

data by some jurisdictions but not others. Therefore, comparisons between jurisdictions should be made with caution.

The Indigenous status data should be interpreted with caution due to the varying and, in some instances, unknown quality of Indigenous identification across jurisdictions. Indigenous status was missing or not reported for around 7 per cent of all clients in 2013-14.

Private data

Coverage of private hospitals includes all private hospital with designated psychiatric beds and private psychiatric day hospitals.

The data provided are an estimate of overall activity. Actual counts are multiplied by a factor that accounts for the proportion of data missing from the CDMS collection. That adjustment is performed at the level of State and Territory and also financial year, since non-participation rates varied from state to state and financial year.

Patient counts are unique at the hospital level, therefore, duplication of persons in this data may be possible.

Indigenous status information is not collected for these data.

Health MBS and DVA TAS data

As with any administrative system a small degree of error may be present in the data captured.

Data used for statistical purposes are based on enrolment postcode of the patient. This postcode may not reflect the current postcode of the patient if an address change has not been notified to DHS.

The data provided are based on the date on which the claim was processed by DHS, not when the service was rendered. The use of data based on when the claim was processed, rather than when the service was rendered, produces little difference in the total number of persons included in the numerator for the reference period.

People who received more than one type of service are counted once only in the calculations for this indicator.

Health MBS data presented by Indigenous status have been adjusted for underidentification in the DHS Voluntary Indigenous Identifier (VII) database. Indigenous rates are therefore modelled and should be interpreted with caution. These statistics are not derived from the total Australian Indigenous population, but from those Aboriginal and Torres Strait Islander people who have voluntarily identified as Indigenous to DHS. The statistics have been adjusted to reflect demographic characteristics of the overall Indigenous population, but this adjustment may not address all the differences in the service use patterns of the enrolled population relative to the total Indigenous population. The level of VII enrolment (61 per cent nationally as at August 2012) varies across age-sex-remoteness-State/Territory subgroups and over time which means that the extent of adjustment required varies across jurisdictions and over time. The methodology for this adjustment was developed and verified by the AIHW and Health for assessment of MBS and PBS service use and expenditure for Indigenous Australians. For an explanation of the methodology, see Expenditure on health for Aboriginal and Torres Strait Islander people 2006-07.

DVA TAS data are not available by Indigenous status.

Coherence

Following the 2011 Census of Population of Housing, the Australian Bureau of Statistics (ABS) has rebased the Australian population back to 1991. This rebasing had a significant impact on the population time series, therefore data were resupplied in previous reporting cycles for previous years using the rebased Estimated Resident Population (ERP) and rebased Indigenous population data.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be

referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006.

Data for 2007-08 through to 2010-11 reported by remoteness are reported for RA 2006. Data for 2011-12 and subsequent years are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2010-11 and previous years are not directly comparable to remoteness data for 2011-12 and subsequent years.

Data for 2007-08 through to 2010-11 reported for SEIFA deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. Data for 2012-13 and subsequent years are reported using SEIFA 2011 at the Statistical Area (SA) 2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012-13 and subsequent years.

Public data

Public data for all collection periods were re-supplied in 2012-13 by jurisdictions due to an expanded scope that includes all specialised public mental health services. Historical disaggregated data were not re-supplied, therefore, comparisons with 2012-13 and later for any disaggregated data is not valid. As mentioned above, public historical Indigenous data were re-calculated with the revised Indigenous population data, however, as per this coherence issue, historical comparisons with 2012-13 and later data are not valid.

Queensland and Western Australia have provided updated data for 2012-13, thus the 2012-13 data have been updated and resupplied in this reporting cycle.

For public sector community mental health services, Victorian data is unavailable (for 2011-12 and 2012-13) due to service level collection gaps resulting from protected industrial action during this period. Industrial action during the 2011-12 and 2012-13 collection periods in Tasmania has limited the available data quality and quantity of data. Australian totals for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution. Australian totals for 2011-12 and 2012-13 should not be compared to previous or subsequent years.

Tasmania has been progressively implementing a state-wide patient identification system. Data for 2012-13 is considered to be the first collection period with this system fully implemented. Tasmanian data for 2007-08 and 2008-09 include people who received a Helpline services. From 2009-10 onwards these have been excluded consistent with the indicator definitions. Data for 2007-08 and 2008-09 are also limited to people who accessed Community mental health services only. Therefore, Tasmanian data is not comparable across years.

In past years there has been variation in the underlying concept used to allocate remoteness and socioeconomic status across jurisdictions (i.e. location of service provider, location of client or a combination of both). In addition, the underlying concordances used by jurisdictions to allocate remoteness may vary. Since 2009-10, remoteness and socioeconomic status have been allocated using the SLA of the client at last contact. For 2011-12 data all jurisdictions have used the same concordance and proportionally allocated records to remoteness and Socio-Economic Indexes for Areas (SEIFA) categories with the following exception:

- New South Wales and the Northern Territory used postcode concordance (rather than SLA concordance) to allocate records to remoteness and SEIFA.
- From 2009-10 onwards, disaggregation by SEIFA is based on a person's
 usual residence, not the location of the service provider, except for the
 Northern Territory data for which the majority of the data was based on the
 location of the service. Due to system-related issues impacting data quality,
 Tasmania was unable to provide data by SEIFA for 2008-09.

Comparisons over time for remoteness and socioeconomic status should therefore be interpreted with caution.

Private data

There has been no change to the methodology used to collect the data in 2013-14. Therefore, the data are comparable to previous reporting periods.

Health MBS and DVA TAS data

The same methodology to attribute demographic information to the data has been used in 2013-14 as in previous reporting periods.

For 2010-11 and previous years, remoteness and socioeconomic status for both Health MBS and DVA TAS data were allocated using a postcode concordance. For 2011-12 and subsequent years, DVA TAS data were allocated to remoteness using geocoding, and to socioeconomic status using an SLA/SA2 concordance.

MBS items 81325 and 81355 were added from 1 November 2008. These items relate to mental health or psychological services provided to a person who identified as being of Aboriginal or Torres Strait Islander descent.

On 1 January 2010, a new MBS item (2702) was introduced for patients of GPs who have not undertaken mental health skills training. Changes have been made to the existing MBS item 2710 to allow patients of GPs who have undertaken mental health skills training to access a higher rebate. Both of these items relate to the preparation of a GP mental health treatment plan.

On 1 November 2011, MBS items 2715 and 2717 were introduced to cover preparation of a GP mental health treatment plan by a GP who has undertaken mental health skills training. At the same time MBS items 2700 and 2701 were introduced to cover preparation of a GP mental health treatment plan by a GP who has not undertaken mental health skills training.

On 1 July 2011, MBS item 288 was introduced as a telehealth mental health related item.

MBS item 2719 existed from 1 November 2011 to 30 April 2012.

From 2011-12 MBS item 20104 is included to align with other national indicators.

Caution should be taken when interpreting Indigenous rates over time. All other data can be meaningfully compared across reference periods.

Other publications

The AIHW publication series Mental health services in Australia contains data that is comparable in coverage (using different MBS item splits) and includes a summary of MBS mental health-related items.

The data used in this indicator is also published in the COAG National Action Plan on Mental Health — final progress report covering implementation to 2010-11. There may be some differences between the data published in these two sources as:

rates may be calculated using different ERPs other than the June ERPs used for this indicator.

MBS numbers are extracted using a different methodology. The COAG National Action Plan on Mental Health — final progress report covering implementation to 2010-11 counts a patient in each state they resided in during the reference period but only once in the total whereas this indicator counts a patient in only one State/Territory.

The indicator specifications and analysis methodology used for this report are equivalent to the Healthcare 2011-12: comparing performance across Australia.

Accessibility

MBS statistics are available at:

- www.health.gov.au/internet/main/publishing.nsf/Content/Medicare+Statistics-1
- www.medicareaustralia.gov.au/statistics/mbs_item.shtml

Disaggregation of MBS data by SEIFA is not publicly available elsewhere.

Interpretability

Information is available for MBS data from:

 www.health.gov.au/internet/mbsonline/publishing.nsf/content/medicare-benefit s-schedule-mbs-1

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- This is a proxy measure of access to appropriate care.
- State and Territory jurisdictions differ in their approaches to counting clients under care, including different thresholds for registering a client. Additionally, they differ in their capacity to provide accurate estimates of individual persons receiving mental health services. Therefore comparisons between jurisdictions need to be made with caution.
- The Indigenous status data should be interpreted with caution:
 - public sector community mental health services (Public) data: There is varying and, in some instances, unknown quality of Aboriginal and Torres Strait Islander identification among jurisdictional data sources.
 - Medicare Benefits Schedule (MBS) data: have been adjusted for under-identification of Indigenous status in the Medicare Australia Voluntary Indigenous Identifier (VII) database
- Disaggregation of this indicator by Indigenous status for private patients and those recorded in DVA data is a priority.
- Remoteness data for 2010-11 and previous years are not directly comparable to remoteness data for 2011-12 and subsequent years.
- SEIFA data for 2010-11 and previous years are not directly comparable with SEIFA data for 2011-12, and SEIFA data for 2011-12 and previous years are not directly comparable with SEIFA data for 2012-13 and subsequent years.
- For public sector community mental health services, Victorian data is unavailable (for 2011-12 and 2012-13) due to service level collection gaps resulting from protected industrial action during this period. Industrial action during the 2011-12 and 2012-13 collection periods in Tasmania has limited the available data quality and quantity of data. Australian totals of public sector community mental health services for 2011-12 and 2012-13 only include available data and should therefore be interpreted with caution. Australian totals for 2011-12 and 2012-13 should not be compared to previous years.
- Historical disaggregated data up to 2011-12 does not match the scope of data from 2012-13, therefore, comparisons between these years for any disaggregated data is not valid.
- Data have been provided according to the State or Territory of service, but at the sub-state level (remoteness area) have been classified by the client's place of usual residence. For example, a person who usually resides in a very remote area of the NT and is treated by a service in a major city in Victoria would be classified at the sub-state level as a very remote area of Victoria (even though Victoria itself has no very remote areas under the ABS remoteness classification). Further work is required to determine whether geographic location for this indicator should be based on usual residence of the client (used for most indicators) or location of the service.
- Data linkage work is underway to obtain comprehensive and consistent data on people with mental illness across the full scope of service types.

Primary mental health care for children and young people

DQI for this indicator has been sourced from the Australian Government (Department of Health) with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — access

Indicator Primary mental health care for children and young people

Measure Description:

(computation) Proportion of young people aged under 25 years who received a primary mental health

care services subsidised through the MBS. Data are also reported by four age cohorts: pre-school (0-<5 years), primary school (5-<12 years), secondary school (12-<18

years) and youth/young adult (18-<25 years).

Numerator:

Number of young people aged under 25 years who received a primary mental health care services subsidised through the MBS and by age cohort (pre-school (0-<5 years), primary school (5-<12 years), secondary school (12-<18 years) and youth/young adult (18-<25 years).

Denominator:

ERP aged under 25 years and by age cohort (pre-school (0–<5 years), primary school (5–<12 years), secondary school (12–<18 years) and youth/young adult (18–<25 years).

Computation:

Expressed as a proportion: (Numerator/s ÷ Denominator/s)*100.

Calculated for all young people (aged under 25 years) and separately by age cohort,

gender, Indigenous status, remoteness, SEIFA and service type.

Data source/s Numerator:

Department of Health MBS Statistics data.

Denominator:

ABS Australian Demographic Statistics.

Data Quality Framework Dimensions

Institutional environment

MBS data are an administrative by-product of the DHS, Medicare fee-for-service payment systems. DHS, Medicare collects MBS data under the *Human Services* (Medicare) Act 1973 and regularly provides the data to Department of Health.

The ABS operates within a framework of the *Census and Statistics Act 1905* and the *Australian Bureau of Statistics Act 1975*. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment at www.abs.gov.au.

Relevance

Includes primary mental health care covered by the MBS only. Other relevant forms of primary mental health care for young people are not incorporated due to a lack of available data, including community health centres, Aboriginal Community Controlled Health Services, school counsellors and health nurses, university and Technical and Further Education counselling services and a component of the mental health care provided by state/territory specialised public mental health services.

MBS data are counts of young people receiving mental health-specific MBS services for which DHS has processed a claim, excluding those for psychiatrists. The relevant MBS items are as follows:

GP and other services include MBS items 170, 171, 172, 2574, 2575, 2577, 2578, 2700, 2701, 2702, 2704, 2705, 2707, 2708, 2710, 2712, 2713, 2715, 2717,

2719, 2721, 2723, 2725, 2727.

- Clinical psychologist services include MBS items 80000, 80005, 80010, 80015, 80020.
- Other allied health services include MBS items 10956, 10968, 80100, 80105, 80110, 80115, 80120, 80125, 80130, 80135, 80140, 80145, 80150, 80155, 80160, 80165, 80170, 81325, 81355, 82000, 82015.

Analyses by state/territory of MBS data is based on postcode of residence of the client as recorded by DHS at the date of last service processed in the reference period. As clients may receive services in locations other than where they live, these data do not necessarily reflect the location in which services were received. The allocation to the state/territory uses a concordance and splits a person where the postcode covers more than one state/territory, therefore the totals may not equal the sum of the individual cells due to rounding.

MBS data are based on the date the claim was processed. Age of the patient is based on their age at the date of the service.

The population data are for the 30 June of the proceeding financial year. For 2013-14 data, it is June 2013. All ERP data are based on the 2011 Census of Population and Housing .

Timeliness

MBS claims data are available within 14 days of the end of a month. The reference period for the latest data is 2014-15.

Accuracy

DVA TAS data are not available.

As with any administrative system a small degree of error may be present in the data captured.

For SEIFA and remoteness reporting, data are excluded for patients whose postcodes do not map to a SEIFA or remoteness area. These patients are reported in a 'not stated' category.

Data used for statistical purposes are based on enrolment postcode of the patient. This postcode may not reflect the current postcode of the patient if an address change has not been notified to DHS.

Analyses by age are based on the client's as recorded by DHS, Medicare at the date the last service that was received in the reference period.

The data provided are based on the date on which the claim was processed by DHS, not when the service was rendered. The use of data based on when the claim was processed, rather than when the service was rendered, produces little difference in the total number of persons included in the numerator for the reference period.

People who received more than one type of service are counted once only in the calculations for this indicator.

Health MBS data presented by Indigenous status have been adjusted for under-identification in the DHS Voluntary Indigenous Identifier (VII) database. Aboriginal and Torres Strait Islander rates are therefore modelled and should be interpreted with caution. These statistics are not derived from the total Australian Aboriginal and Torres Strait Islander population, but from those Aboriginal and Torres Strait Islander people who have voluntarily identified as Aboriginal and Torres Strait Islander to DHS. The statistics have been adjusted to reflect demographic characteristics of the overall Aboriginal and Torres Strait Islander population, but this adjustment may not address all the differences in the service use patterns of the enrolled population relative to the total Aboriginal and Torres Strait Islander population. The level of VII enrolment (61 per cent nationally as at August 2012) varies across age-sex-remoteness-State/Territory sub-groups and over time which means that the extent of adjustment required varies across jurisdictions and over time. The methodology for this adjustment was developed and verified by the AIHW and Health for assessment of MBS and PBS service use and expenditure for Aboriginal and Torres Strait Islander Australians. For an explanation of the methodology, see Expenditure on health for Aboriginal and Torres Strait Islander people 2006-07.

Coherence

Estimates are compiled the same way across jurisdictions and over time.

The MBS items included can change over time, for example 2700, 2701, 2715 and

2719 were included for the later years of data.

Accessibility

MBS statistics are available at:

- www.health.gov.au/internet/main/publishing.nsf/Content/Medicare+Statistics-1
- www.medicareaustralia.gov.au/statistics/mbs_item.shtml

Interpretability

Information for understanding this indicator is available in the:

- Fourth national mental health plan: measurement strategy, www.health.gov.au/internet/mhsc/publishing.nsf/Content/pub-plan4-meas
- National mental health reports www.health.gov.au/internet/main/publishing.nsf/Content/mental-data.

Data Gaps/Issues Analysis

Key data gaps/issues

- Not all relevant forms of primary mental health care for young people are not incorporated due to a lack of available data.
- Annual data are available. The most recent data available are for 2014-15.
- The data are consistent and comparable over time.

Services reviewed against the National Standards

DQI for this indicator has been sourced from the AIHW and state and territory health authorities, with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — appropriateness

Indicator Services reviewed against the National Standards for Mental Health Services (NSMHS)

Measure <u>Description:</u>

(computation) Proportion of expenditure on specialised public mental health services that had

completed a review by an external accreditation agency against the NSMHS.

Numerator/s:

Expenditure on service units, by assessed level (level 1, level 2, level 3, level 4).

Denominator:

Total expenditure on service units in scope for the NSMHS.

Computation:

Expressed as a proportion: (Numerator/s ÷ Denominator)*100. Calculated separately by

assessed level.

Data source/s AIHW from the Mental Health Establishments (MHE) NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds,

separations, contact and episodes). Specialised psychiatric care in non-specialised public mental health inpatient units is not in scope of the MHE NMDS.

The NSMHS were first introduced in 1996 and were adopted by all public specialised mental health services and private psychiatric hospitals. Most non-government community mental health services found it difficult to apply many of the NSMHS to the context within which they operated¹. Revised standards were endorsed in September 2010 and these are designed to be applied across the broad range of mental health services (where mental health is the main focus of care), including non-government organisations and private office based services (such as GPs). Coverage of all publicly

¹ DoHA 2010, National Standards for Mental Health Services: Implementation guidelines for Non-government Community Services, Australian Government, Canberra.

funded mental health services to which the revised NSMHS now apply would improve the relevance of these data to measurement of this indicator for future reports.

Services were assessed as level 1, level 2, level 3, or level 4 where these levels are defined as:

- Services at level 1 the number of specialised public mental health services that
 have been reviewed by an external accreditation agency and judged to have met
 all NSMHS.
- Services at level 2 the number of specialised public mental health services that
 have been reviewed by an external accreditation agency and judged to have met
 some but not all NSMHS.
- Services at level 3 the number of specialised public mental health services that
 are (i) in the process of being reviewed by an external accreditation agency but
 the outcomes are not known, or (ii) booked for review by an external accreditation
 agency.
- Services at level 4 the number of specialised public mental health services that
 do not meet criteria detailed under levels 1 to 3, except those for whom the
 NSMHS do not apply code 8 in the MHE NMDS.

Assessments against the NSMHS are based on periodic reviews, usually conducted every three to five years. Services assigned a level 1 for the 2011-12 data may have been assessed at this level in a review that was conducted in 2005-06 and therefore this assessed level may not necessary reflect the quality of the actual services delivered in the 2011-12 reference period, nor the extent to which the NSMHS are used for ongoing quality improvement.

The data element 'National standards for mental health service review status' is collected at the statistical unit of service unit (admitted patient, ambulatory and residential). Specialised mental health service units relate to units in public psychiatric hospitals, designated psychiatric units in acute care hospitals, public community-based ambulatory and residential services and publicly funded private hospital and non-government residential service units. Non-government operated community residential service units are excluded from the analysis. Aged care community residential services in receipt of funding under the Aged Care Act 1997 are subject to residential aged care reporting and service standard requirements and are therefore excluded from the NSMHS analysis. Ambulatory services managed by non-government organisations are not defined as statistical units for the MHE NMDS and therefore data on this element are not available for these service types.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation, on an annual basis approximately nine months after the reference period. The reference period for the most recent data is 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope services for the 'National standards for mental health service review status' data element is complete across jurisdictions and years.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AIHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AIHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AIHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

Due to ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

Coherence

Data are reported for each year from 2005-06 to 2013-14.

The data reported from 2005-06 to 2009-10 all relate to specialised mental health services assessed against the old NSMHS. Data from 2010-11 will progressively include larger proportions of services assessed against the revised NSMHS that were endorsed in September 2010.

External accreditation agencies can undertake accreditation of a parent health organisation (for example, a hospital) that can cover a number of specialised mental health service units. Accreditation of the parent organisation does not currently require an individual service unit (for example, a community-based ambulatory service managed by the hospital) to be assessed separately against the NSMHS. Assessment against the NSMHS for a service unit must be specifically requested and involves a separate review process. This leads to variation across states and territories in the method used to assign an assessment level (1, 2, 3 or 4) to service units. In some states and territories, if an organisation with multiple service units is assessed at a particular level all the organisation's units are 'counted' at that assessment level. In other jurisdictions, assessments are conducted at the service unit level and the level assigned may or may not be consistent with the other units within the organisation. The approach can also vary across organisations within a single jurisdiction.

The external accreditation agencies such as Australian Council on Healthcare Standards (ACHS) and Quality Improvement Council (QIC) can use differing review methods. In addition, external review is a process of negotiation between a mental health service organisation and the accrediting agency. There may be differences in the extent to which all or some of the NSMHS are considered to be applicable to individual service units.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports
- Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Unpublished MHE NMDS data are available from the AIHW on request, but clearance for use of these data for a specific purpose needs to be provided by states and territories and there may be costs incurred in gaining access. Cell sizes with small numbers may be suppressed.

Interpretability

Metadata information for the MHE NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Information for understanding this indicator is also available:

- in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition
- from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

- There is variation across and within states and territories in the method used to assign an assessment level (1, 2, 3 or 4) to service units. This may affect the comparability of the results across jurisdictions.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Services provided in an appropriate setting

DQI for this indicator has been sourced from the AIHW and state and territory health authorities, with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — appropriateness

Indicator Services provided in an appropriate setting

Measure <u>Description:</u>

(computation) Recurrent expenditure on community-based services as a proportion of total

expenditure on mental health services.

Numerator:

Governments' recurrent expenditure on community-based specialised mental health services. Community-based recurrent expenditure for this indicator includes expenditure on ambulatory care, non-government organisations and adult residential services. Aged residential care expenditure is excluded.

Denominator:

Total government recurrent expenditure on specialised mental health services, excluding aged residential care expenditure and unapportioned indirect expenditure.

Computation:

Expressed as a proportion: (Numerator/Denominator)*100.

Data source/s Numerator and Denominator: AIHW from the MHE NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes). Specialised psychiatric care in non-specialised public mental health inpatient units is not in scope of the MHE NMDS.

The data elements on direct and indirect recurrent expenditure and grants to non-government organisations are collected at levels in the hierarchy used to capture jurisdiction-wide information on mental health services (state/territory, region, organisation and service units). Non-government grants are collected at the regional and state and territory levels. Direct recurrent expenditure comprises salaries and wages and non-salary expenditure, and is collected at the individual service unit level. Indirect recurrent expenditure is additional expenditure associated with the provision of mental health services not incurred or reported at the individual service unit level. Some indirect expenditure reported at the organisational and regional level can be directly linked to the provision of services by service units and is apportioned to individual

service units. The estimates do not include residual indirect expenditure incurred at the state and territory level or that unapportioned from the organisational or regional level.

Certain categories of expenditure collected under the MHE NMDS are excluded to derive this indicator and improve the relevance of these data to its measurement.

- Community aged residential care expenditure is excluded from community-based expenditure to improve comparability across states and territories. A significant share of jurisdictions do not have this service type.
- Indirect expenditure at the State and Territory level and indirect expenditure at the
 organisational or regional level that cannot be apportioned to individual services is
 also excluded. This indicator is seeking to measure the service mix by showing
 the proportion of expenditure that is community-based relative to the other
 categories of service expenditure (admitted patients) and not relative to total
 expenditure, which includes indirect expenditure at the State or Territory level on
 areas such as program administration and property leasing costs.

Government expenditure on mental health services that are out of scope of the MHE NMDS, such as Medicare-subsidises for community-based services provided by GPs or the personal helpers and mentors program is not included in the analysis.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation, on an annual basis approximately nine months after the reference period. The reference period for the most recent data is 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope mental health services' recurrent expenditure is essentially complete across jurisdictions and years.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AlHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AlHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AlHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AlHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

Coherence

Data are reported for each year from 2005-06 to 2013-14. There has been no major change to the method used to collect the data or to derive the results across years for the majority of jurisdictions, therefore the data are largely comparable across most jurisdictions and years.

For NSW, Confused and Disturbed Elderly (CADE) residential mental health services were reclassified as admitted patient hospital services from 1 July 2007. All data relating to these services have been reclassified from 2007-08 onwards, including expenditure. Comparison of NSW data over time therefore should be approached with caution.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- · National Mental Health Reports.

Unpublished MHE NMDS data are available from the AIHW on request, but clearance for use of these data for a specific purpose needs to be provided by states and territories and there may be costs incurred in their provision. Cells may be suppressed for confidentiality reasons or where estimates are based on small numbers, resulting in low reliability.

Interpretability

Metadata information for the MHE NMDS are published in the AlHW's online metadata repository — METeOR and in the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

• Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Collection of outcomes information

DQI for this indicator has been sourced from the Australian Mental Health Outcomes and Classification Network (AMHOCN), Department of Health, AIHW and State and Territory governments with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — appropriateness

Indicator Collection of information on consumers' outcomes. This DQI should be considered in

conjunction with the DQI for Mental health outcomes of consumers of specialised public

mental health services.

Measure (computation)

Description:

Proportion of specialised public mental health service episodes with completed clinical mental health outcome measures data, by consumer type (people in ongoing community-based care, people discharged from community-based care and people

discharged from hospital).

Numerator:

Number of specialised public mental health service episodes with completed clinical

mental health outcome measures data, by consumer type.

Denominator:

Estimated number of specialised public mental health service episodes, by consumer

type.

Computation:

Expressed as a proportion: (Numerator/s ÷ Denominator)*100. Calculated separately by

consumer type.

Data source/s Numerator:

State and territory health authorities' data reported to the National Outcomes and

Casemix Collection (NOCC) and analysed by the AMHOCN.

Denominator:

State and territory health authorities' data as reported to CMHC NMDS and the Admitted Patient Mental Health Care (APMHC) NMDS and analysed by the Department

of Health.

Data Quality Framework Dimensions

Institutional environment

Health Ministers adopted the routine measurement of consumer outcomes as a priority under the *National Mental Health Strategy (1992)* and in all subsequent National Mental Health Plans. It is also compatible with State and Territory governments' documented policy emphasis on high quality health services and increased consumer and carer participation.

The AMHOCN prepared this indicator using the NOCC data on the Health of the Nation Outcome Scales (HoNOS) family of measures. The Australian Government contracts AMHOCN to support the implementation of the NOCC as part of routine clinical practice by undertaking three functions 1) data bureau — receives and processes information 2) analysis and reporting — analyses and reports on the submitted data and 3) training and service development — supports training in the measures and their use for clinical practice, service management and development purposes.

The NOCC was endorsed by all State and Territory governments in 2003, and all jurisdictions have reported data since 2004-05. The NOCC protocol prescribes a set of standard measures to be collected at particular times (collection occasions) in the clinical process. Under the NOCC protocol, collection of outcomes data is mandatory at admission, review and discharge. Data collected outside of NOCC protocols are excluded from the analysis.

Relevance

The scope of the NOCC is all specialised public mental health services managed by, or

in receipt of funds from, state or territory health authorities. Australian Government funded aged residential services are excluded.

The purpose of the NOCC is to measure consumer outcomes. This indicator relates only to the collection of data for the HoNOS family of measures (HoNOS; HoNOS for Older People (HoNOS 65+) and HoNOS for Children and Adolescents (HoNOSCA). Other consumer outcomes measures are also collected, including those completed by consumers. For adults and older persons these include: Kessler 10 (K10+), Behavior and Symptom Identification Scales (BASIS-32); for children and adolescents, the parent and youth versions of the Strengths and Difficulties Questionnaire (SDQ). The uptake of these measures is not captured by this indicator.

For an episode to be counted as one for which consumer outcome measures are collected, a minimum of two data collection occasions with 'valid' measures within the reference period are required. 'Valid' measures are those with a correctly completed specified number of items, for the:

- HoNOS/HoNOS 65+ a minimum of 10 of the 12 items
- HoNOSCA a minimum of 11 of the first 13 items.

Brief ambulatory and inpatient care episodes (defined as follows) are excluded.

- inpatient care episodes 3 days or less.
- ambulatory episodes where the consumers had a treatment period between 1 and 14 days inclusive.

Ambulatory episodes of mental health care that end because of admission to hospital or residential mental health care are also excluded.

The completion of outcomes data are calculated for three consumer groups. Further, the calculation varies depending on the setting and the duration of the episode of care:

- people discharged from hospital, episodes for people who were admitted and discharged from inpatient care during the reference period (an individual can have two episodes of care so the data represent episode-counts, rather than person-counts) — measures need to be 'valid' for both the admission and discharge occasions rated during the reference period
- people in ongoing community-based care, episodes for people who received community care for the whole of the reference period or who commenced community care sometime after 1 July (beginning of the period) and continued to receive care for the rest of the reference period — measures need to be 'valid' for both the first (either an admission or a review) and last (either an admission or a review) occasions rated during the year
- people discharged from community-based care, episodes for people who were discharged from community care (not including those discharged to hospital) who received an episode of community care that started and ended in the reference period — measures need to be 'valid' for both the admission and discharge occasions rated during the reference period.

Outcomes are measured for consumers discharged from residential mental health care also, but there were too few public mental health service episodes with completed clinical mental health outcome measures data to derive coverage estimates.

The number of 'in-scope' specialised public mental health service episodes, for which outcomes data should be collected (the denominator) is not provided directly to the NOCC, but is an estimate based on the CMHC or APMHC NMDSs. For determining the denominators for consumers in ongoing ambulatory care and those discharged from ambulatory care the following distinguishing definitions are used:

- ongoing the estimated unique count of consumers with CMHC treatment periods of greater than 91 days (that is, from their first service contact date to their last service contact date); LESS the estimated number of consumers whose episodes of care were left censored (that is, commenced in an earlier reporting period by finished within the current reporting periods)
- discharged the estimated unique count of consumers with CMHC treatment periods of 91 days or less (that is, from their first service contact date to their last service contact date); LESS the estimated number of consumers whose episodes of care resulted in a discharge to an inpatient setting.

Data are not available for Victoria for 2011-12 or 2012-13. All Australian totals for

2011-12 and 2012-13 exclude Victoria. Industrial action in Tasmania in 2011-12 and 2012-13 has affected the quality and quantity of data.

Timeliness

State and territory health authorities provide the CMHC and APMHC NMDS data to the AIHW for national collation, on an annual basis approximately six months after the reference period.

State and territory health authorities provide the NOCC data to AMHOCN for national collation, on an annual basis and all data are to be submitted approximately six months after the reference period.

The reference period for the latest data is 2013-14.

Accuracy

States and territories are primarily responsible for the quality of the NOCC data they provide. However, AMHOCN undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage, concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage, primarily concerned with identifying inconsistent, anomalous, and exceptional issues in relation to the NOCC protocol as well as flagging invalid domain values and/or missing data.

Change in consumers' clinical outcomes is not presented for states and territories with less than 200 unique consumer outcomes identifiable within the reference period. States and territories excluded from individual publication are used to calculate the change in consumers' clinical outcomes for Australia.

Coherence

Data are available for 2007-08 to 2013-14.

The numerator and denominator are sourced from different data sets. Estimates of the total number of episodes requiring outcomes assessment is not provided directly to the NOCC, so it is indirectly estimated from the NMDSs (CMHC and APMHC).

The Australian totals for 2011-12 and 2012-13 are not comparable to other years as they exclude data for Victoria.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the CMHC and APMHC NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication mhsa.aihw.gov.au/ home/
- Australia's Health a mental health chapter is included in this biennial publication aihw.gov.au/publication-detail/?id=10737422172
- National mental health reports www.health.gov.au/internet/main/ publishing.nsf/Content/mental-data
- the Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Unpublished NMDS data are available from the AIHW on request, but clearance for use of these data for a specific purpose needs to be provided by states and territories and there may be costs incurred in gaining access. Cell sizes with small numbers may be suppressed.

NOCC data are available on the AMHOCN website amhocn.org/. The following on-line products are available:

- web decision support tool
- NOCC Standard Reports
- NOCC Volume and Percentage Clinical Ratings: Australia
- NOCC data are also published in the National mental health reports www.health.gov.au/internet/main/publishing.nsf/Content/mental-data.

Interpretability

Metadata information for the CMHC and APMHC NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Metadata information for the NOCC are published on the AMHOCN website amhocn.org/.

Information for understanding this indicator is also available:

in the Key Performance Indicators for Australian Public Mental Health Services,

Third Edition

• from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

- The numerator and denominator are sourced from different data sets. Estimates
 of the total number of episodes requiring outcomes assessment is not provided
 directly to the NOCC, so it is indirectly estimated from the NMDSs (CMHC and
 APMHC).
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Rate of seclusion — acute inpatient units

DQI for this indicator has been sourced from the AIHW and State and Territory health authorities with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — quality — safety

Indicator Rate of seclusion — acute inpatient units

Measure (computation)

Definition:

Number of seclusion events per 1000 patient bed days in specialised public mental

health acute inpatient units

Numerator:

Number of seclusion events in specialised public mental health acute inpatient units.

Denominator:

Number of accrued mental health care days in specialised public mental health acute

inpatient units.

Computation:

Expressed as a rate. Calculation is: (Numerator ÷ Denominator) x 1000.

Data source/s

AIHW 2015, Mental Health Services in Australia Online, mhsa.aihw.gov.au/home/.

AIHW publishes data provided by State and Territory governments from their adhoc

seclusion data collections.

Data Quality Framework Dimensions

Institutional environment

The AIHW is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity established in 1987, governed by a management Board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cth) ensures that the data collections managed by the AIHW are kept securely, under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

At present there is no formal, routine nationally agreed collection and reporting framework for seclusion events in specialised mental health public acute hospital services. Data are sourced from state and territory seclusion data collections for

specialised mental health public acute hospital services via Safety and Quality Partnership Standing Committee (SQPSC) a subcommittee, of the Mental Health, Drug and Alcohol Principal Committee (MHDAPC).

The Australian Health Ministers Advisory Council (AHMAC) mental health committees are in the process of formalising the current 'ad hoc' SQPSC seclusion data collection arrangements. The Mental Health Information Strategy Standing Committee (MHISSC) is working with AIHW to develop an aggregate seclusion and restraint Data Set Specification (DSS) to standardise the national collection of both seclusion and restraint data (and provide a more detailed data set) from the 2015-16 collection period.

Relevance

Seclusion is the confinement of the consumer at any time of the day or night alone in a room or area from which free exit is prevented. A seclusion event commences when a clinical decision is made to seclude a mental health consumer and ceases when there is a clinical decision to cease seclusion. If a consumer re-enters seclusion within a short period of time this is considered a new seclusion event. The term 'seclusion event' is utilised to differentiate it from the different definitions of 'seclusion episodes' used across jurisdictions.

Data on seclusion events relates to all specialised mental health public hospital acute services. Wards or units other than specialised mental health services, such as emergency departments, are out of scope for this data collection. Specialised mental health acute forensic hospital services are in scope, regardless of which department manages the service, for example a health department versus a correctional services department.

Timeliness

State and Territory governments provide the data to the AIHW via SQPSC for national collation, approximately three months after the reference period. Data are published within six months of the close of the reference period.

The reference period for the latest data is 2014-15.

Accuracy

Estimated acute bed coverage for 2014-15 seclusion data was over 95 per cent based on acute beds reported to the Mental Health Establishments National Minimum Data Set in 2013-14.

Occasionally, jurisdictions re-supply data for seclusion events or number of occupied bed days. Data re-submissions are highlighted in subsequent data supplies, with updated figures reported in the next annual publication. For 2014-15, historical data were re-supplied for two jurisdictions.

Integrity of the supplied seclusion data is tested by AIHW via a series of 'logical' validation checks. Any missing or unusual data is clarified with the supplying jurisdiction.

Some outliers (that is, a small number of clients who have an above average number of seclusion events) are apparent in the data and were not removed, this has the effect of skewed the rates of seclusion for some jurisdictions.

A new data element, average time in seclusion was captured for the 2013-14 collection period and subsequent collections. As the average time in seclusion is significantly higher for forensic units, these units were excluded from average time in seclusion calculations to provide a more realistic estimation of seclusion duration.

The absence of unit record data limits the ability to undertake analysis to provide context around the incidence of seclusion events. For example, the analysis of consumer attributes which may indicate risk factors or a vulnerability to experiencing seclusion and restraint events (that is, legal status, gender, date of birth, Indigenous status, country of birth).

In addition, identifying the timing of seclusion events within an episode of admitted patient mental health care may be informative in mitigating/pre-empting patterns in the use of restrictive practices. Some jurisdictions have the capacity to record and report this information but the lack of cross-jurisdictional consistency restricts the collection and reporting of unit record data at a national level.

Within the aggregate reporting framework, collection of service unit level data is currently not feasible. Although data are collected at target population, collection at the service unit level would improve consistency and comparability with other mental health collections such as the Mental Health Establishment NMDS.

The use of restrictive practices also includes restraint events. However, no national restraint data are currently reported representing a substantial data gap. The AIHW is currently working with the AHMAC mental health committees and jurisdictional representatives to develop national restraint data standards to facilitate the collection and reporting of national restraint event data.

Coherence

Variations in jurisdictional legislation may result in exceptions to the definition of a seclusion event. Data reported by jurisdictions may not be explicitly comparable, jurisdictional comparisons should therefore be made with caution.

Specific jurisdictional caveats are outlined below:

New South Wales

NSW does not have a centralised database for the collection of seclusion data. Services report seclusion rates regularly to the NSW Ministry of Health. Services are required to maintain local seclusion registers, which may be audited by NSW Official Visitors who function with legislative authority to raise issues in relation to patient safety, care or treatment. Seclusion rates are a Key Performance Indicator (KPI) in regular performance reporting to NSW Local Health Districts. Importantly, NSW seclusion rates include bed days for some forensic services managed by correctional facilities.

Note that in calculating seclusion rates at LHD and State level, all acute bed days are included in the denominator, as per national KPI specifications. This includes facilities where no seclusion occurs, since excluding these facilities would falsely increase the seclusion rate.

No seclusion episodes or bed days were provided for facilities which had not yet opened in the earlier part of the collection period.

The proportion of episodes with a seclusion event may be underestimated in some facilities containing multiple acute units, due to the duplicate counting of hospital stays at facility level. The method used in the seclusion collection for the admitted mental health separations will be reviewed.

Victoria

Victoria have comparably lower bed numbers than other jurisdictions, and as such, it may be useful to view the rate of seclusion events in a broader population context (rates per capita).

Seclusion events per 10 000 population in Victoria was 7.2 in 2011-12, 5.8 in 2012-13, 5.5 in 2013-14, and 4.5 in 2014-15.

Queensland

Queensland do not report any acute forensic services to the collection, however forensic patients can and do access acute care through general units.

Lady Cilento Children's Hospital commenced operation in December 2014 replacing the Mater Public Children's Hospital and Royal Children's Hospital. One hospital has activity that through the Patient Administration System is classified as having psychiatric care for children and adolescents. However, these beds are not classified as specialist mental health beds as reported by the hospital to the Mental Health Establishments (MHE) NMDS. Therefore there will be a mismatch of information between the establishment characteristics listed here and those listed in the MHE NMDS.

There are a number of extreme outliers in regards to duration that have significant impact on duration data. These are a combination of data entry error on legal documentation and actual long seclusions. Due to the timeframe required for submission, 2014-15 data is preliminary and includes imputed episodes of care where source data is not yet available.

Western Australia

It should be noted that WA does not have a centralised data base for the collection of seclusion data. Services provided seclusion data from their own data bases. The Chief Psychiatrist in WA has requested, from 1 July 2014, quarterly reporting of seclusion and restraint rates by all current reporting services.

WA has noted two methodologies for calculating 'Accrued mental health care days' to the Mental Health Establishment NMDS and to the Seclusion and Restraint 'ad hoc' collection denominator. Each has used their own data source and methodology to calculate 'Accrued mental health care days'. WA will investigate these differences further and work towards resolving the discrepancies for future data supplied.

In supplying 2014-15 Seclusion and Restraint data, the same methodology has been used as in 2013-14 for consistency, however as mentioned, there will be differences between the MHE NMDS. The 'N Accrued Care Days' for Seclusion and Restraint is supplied from the state data collection which counts the number of beds occupied every midnight. The following inclusions and exclusions that apply to the number of accrued care days for WA:

- Excludes same-day separations
- Excludes leave days where the bed is counted as not occupied at midnight, or where the bed is occupied by another patient at midnight during the leave period
- Includes all specialised mental health inpatient wards
- Includes hospital in the home wards
- Includes only those care days within each financial year, and includes patients admitted through the entire financial year.

South Australia

Recent data reporting improvements will impact on SA data. Importantly, bed days used to calculate SA's seclusion rates are estimated based on 100 per cent occupied bed numbers, which are fluctuating in relation to new infrastructure projects. During 2010-11, a substantial number of seclusion events in one particular hospital were for a small number of patients with over half of these being patient-requested events. This may have impacted on the overall seclusion rate reported for the state for 2010-11.

SA was unable to supply seclusion data for 2008-09. Information on seclusion duration is only available in 4 hour blocks, therefore averages cannot be calculated and seclusion duration figures for SA are not included in national totals.

Tasmania

The increase in the state-wide Tasmanian seclusion rate for 2012-13 and 2013-14 data is due to a small number of clients having an above average number of seclusion events

Australian Capital Territory

When interpreting these data, the relative small size of the ACT should be noted, with a total of between 63 and 70 acute inpatient beds reported between 2008-09 and 2013-14.

Work is progressive and ongoing as part of a larger process of providing a place of improved safety and security, both for people experiencing an acute episode of mental ill health leading to an inpatient admission, visitors and for the staff who work in this challenging environment.

Northern Territory

The NT was unable to supply seclusion data for 2008-09.

The NT is unable to segregate Forensic Inpatient Episodes and Events from general events. Therefore all NT totals, wherever stated, are comprised of both General and Forensic Inpatient Episodes and Events. As this may artificially inflate NT data, caution should be used when comparing or interpreting this data.

Due to the low ratio of beds per person in the NT compared with other jurisdictions, the apparent rate of seclusion is inflated when reporting seclusion per patient day compared with reporting on a population basis.

Due to the low number of beds in NT, high rates of seclusion for a few individuals have a disproportional effect on the rate of seclusion reported.

NT seclusion data is therefore not directly comparable with other jurisdictions.

Accessibility

Seclusion data are available at AIHW's Mental Health Services in Australia — annual publication (https://mhsa.aihw.gov.au/services/admitted-patient/restrictive-practices).

28

Additional disaggregation of the seclusion data are in this AIHW publication. Additional disaggregation of the seclusion data are in this AIHW publication.

Interpretability

Information is available for interpreting seclusion data from AIHW's Mental Health Services in Australia — annual publication (mhsa.aihw.gov.au/services/admitted -patient/restrictive-practices).

Data Gaps/Issues Analysis

Key data gaps/issues

- The absence of unit record data limits the ability to undertake analysis to provide context around the incidence of seclusion events. For example, the analysis of consumer attributes which may indicate risk factors or a vulnerability to experiencing seclusion and restraint events (for example, legal status, gender, date of birth, Indigenous status, and country of birth).
- In addition, identifying the timing of seclusion events within an episode of admitted
 patient mental health care may be informative in mitigating/pre-empting patterns
 in the use of restrictive practices. Some jurisdictions have the capacity to record
 and report this information but the lack of cross-jurisdictional consistency restricts
 the collection and reporting of unit record data at a national level.
- Within the aggregate reporting framework, collection of service unit level data is currently not feasible. Collection at this level would improve consistency and comparability with other mental health collections such as the Mental Health Establishment NMDS.
- The use of restrictive practices also includes restraint events. However, no national restraint data are currently reported representing a substantial data gap. The AIHW is currently working with the AHMAC mental health committees and jurisdictional representatives to develop national restraint data standards to facilitate the collection and reporting of national restraint event data.

Consumer and carer involvement in decision making

DQI for this indicator has been sourced from the AIHW and state and territory health authorities, with additional Steering Committee comments.

Indicator definition and description

Element Effectiveness — Quality — Responsiveness

Indicator Consumer and carer involvement in decision making

Measure Description:

(computation) Number of paid full time equivalent (FTE) consumer OR carer staff per 1000 FTE direct

care, carer and consumer staff

Numerator:

1) Number of paid FTE consumer staff.

2) Number of paid FTE carer staff.

Denominator:

Number of paid FTE direct care, carer and consumer staff.

Computation:

Expressed as a proportion per 1000 FTE. Calculation

is:(Numerator/Denominator*1000).

Data source/s Numerator and Denominator: AIHW from the MHE NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes). Specialised psychiatric care in non-specialised public mental health inpatient units is not in scope of the MHE NMDS.

Direct care staff comprise consultant psychiatrists and psychiatrists, psychiatry registrars and trainees, other medical officers, registered nurses, enrolled nurses, occupational therapists, social workers, psychologists, other diagnostic and health professionals and other personal care staff. Other categories of staff who work in mental health services are collected under the MHE NMDS, such as administrative and clerical staff, but are not included.

Mental health consumer and carer workers are individuals who are employed on a paid basis to represent the interests of consumers and carers, respectively, and advocate for their needs. The person must be employed for the expertise developed from their lived experience of mental illness. The person should also receive a salary or contract fee on a regular basis and it excludes individuals who only received reimbursement of

expenses or occasional sitting fees for attendance at meetings.

The MHE NMDS does not collect information on the staffing of, or consumer and carer participation in, specialised ambulatory mental health services managed by government-funded NGOs.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation on an annual basis, approximately nine months after the reference period. The reference period for the most recent data is 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope mental health services for direct care staff and consumer and carer workers may not be complete across jurisdictions and years due to the transition from a count of consumer/carer consultants up to 2009-10 to a count of mental health consumer/carer workers from 2010-11.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AlHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage overseen by the Department of Health and managed by the AlHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AlHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AlHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

WA have advised that data on FTE consumer or carer workers per 1000 direct care, consumer and carer staff do not accurately represent consumer and carer participation strategies used in WA.

Coherence

Data are reported for each year from 2005-06 to 2013-14. Data up to 2009-10 were restricted to consumer/carer consultants. In 2010-11, the definitions were altered to include a broader range of roles in the contemporary mental health environment, transitioning to mental health consumer and carer workers. These improved definitions should promote greater consistency between jurisdictions. Comparisons between data up to 2009-10 and data from 2010-11 should not be made.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports.

Interpretability

Metadata information for the MHE NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

- From 2010-11, the definitions of consumer/carer workers were altered to include a
 broader range of roles in the contemporary mental health environment,
 transitioning to mental health consumer and carer workers. These improved
 definitions should promote greater consistency between jurisdictions.
 Comparisons between data up to 2009-10 and data from 2010-11 should not be
 made.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Community follow-up after psychiatric admission/hospitalisation

DQI for this indicator has been sourced from the AIHW for the National Healthcare Agreement with additional Steering Committee comments.

Indicator definition and description

Element Quality — Continuity

Indicator Community follow-up after psychiatric admission/hospitalisation — rate of community

follow-up within first seven days of discharge from a psychiatric admission.

Measure (computation)

Proportion of separations from the mental health service organisation's acute psychiatric inpatient unit(s) for which a community ambulatory service contact, in which the consumer participated, was recorded in the seven days following that separation.

The *numerator* is the number of in-scope separations from the mental health service organisation's acute psychiatric inpatient unit(s) for which a community ambulatory service contact, in which the consumer participated, was recorded in the seven days

following that separation.

The denominator is the number of in-scope separations for the mental health service

organisation's acute psychiatric inpatient unit(s).

Calculation is 100 x (Numerator ÷ Denominator)

Data source/s

State/territory admitted patient and CMHC data.

Data Quality Framework Dimensions

Institutional environment

The tables for this indicator were prepared by the AIHW based on data supplied by state and territory health authorities. The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

AIHW drafted the initial data quality statement (including providing input about the methodology used to extract the data and any data anomalies) in consultation with State and Territory health authorities.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities receive these data from public sector community mental health services and public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. The AIHW does not hold the relevant nationally mandated datasets required to independently verify the data tables for this indicator.

Community mental health services and public hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data for publication in the RoGS 2016 and for the indicators section of the AIHW's *Mental health services in Australia website*.

Relevance

Estimates are based on all 'in scope' separations from state and territory psychiatric acute inpatient units, where 'in scope' is defined as those separations for which it is meaningful to examine community follow-up rates. The following separations were excluded: same day separations; statistical and change of care type separations; separations that end by transfer to another acute psychiatric hospital; separations that end by death, left against medical advice/discharge at own risk; separations where the length of stay is one night and a procedure code for ECT is recorded and separations that end by transfer to community residential mental health services.

Data for all years reflect full financial year activity – that is, all in scope separations from public sector acute psychiatric units between the period 1 July and 30 June for each financial year.

Community mental health contacts counted for determining whether follow-up occurred are restricted to those in which the consumer participated. These may be face-to-face or 'indirect' (e.g., by telephone), but not contacts delivered 'on behalf of the client' in which they did not participate, with the exception of the NT which includes all contacts, but

advised that the impact on the indicator is believed to be marginal. Contacts made on the day of discharge are also excluded for all jurisdictions.

Only community mental health contacts made by state and territory public mental health services are included. Where responsibility for clinical follow-up is managed outside the state/territory mental health system (e.g., by private psychiatrists, general practitioners), these contacts are not included.

States and territories vary in their capacity to accurately track post-discharge follow-up between hospital and community mental health care services, due to the lack of unique patient identifiers or data matching systems.

- Tasmania has been progressively implementing a state-wide patient identification system. Data for 2012-13 is considered to be the first collection period with this system fully implemented. The improved patient identification system has increased the percentage post-discharge community care reported by Tasmania in 2013-14. Therefore, Tasmanian data is not comparable across years.
- Western Australia indicated that submitted data was not based on a unique state-wide patient identifier system, but rather data linkage which uses probabilistic matching. Data is therefore subject to change as more information about the patient is collected in statewide data collections.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA). The new remoteness areas are referred to as RA 2011. The new SEIFA are referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006.

Data for 2011-12 and subsequent years are reported for RA 2011.

Data for 2011-12 are reported using SEIFA 2011 at the Statistical Local Area level (an ASGC substate geographical unit). Data for 2012-13 and 2013-14 are reported using SEIFA 2011 at the Statistical Area (SA) 2 level (an ASGS substate geographical unit). The AIHW considers the change from SLA to SA2 to be a series break when applied to data supplied for this indicator. Therefore, SEIFA data for 2011-12 are not directly comparable with SEIFA data for 2012-13 and subsequent years.

Remoteness and socioeconomic status have been allocated using the SA2 or postcode concordance of the client at last contact. For 2012-13 and later years' data all jurisdictions have used the same concordance and proportionally allocated records to remoteness and Socio-Economic Indexes for Areas (SEIFA) categories with the following exception:

 New South Wales used postcode concordance (rather than SA2 concordance) to allocate records to remoteness and SEIFA.

Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider except for the Northern Territory data for which the majority of the data was based on the location of the service. State/territory is reported for the state/territory of the service provider.

Timeliness

The latest reference period for these data is 2013-14.

Accuracy

State and territory jurisdictions differ in their capacity to accurately track post-discharge follow-up between hospital and community service organisations (see Relevance section above for further information).

Due to ongoing validation, historical data could differ from previous reports. Queensland and WA have provided updated data for 2011-12 and 2012-13, thus these data have been updated and resupplied in this reporting cycle.

Coherence

Specifications for this indicator were revised for the National Healthcare Agreement to align with specifications for the nationally agreed key performance indicators for public mental health services. Specifically, the revised indicator focuses on follow-up care for people discharged from acute psychiatric units only, rather than discharges from all psychiatric units.

This indicator is currently reported in the RoGS and in the Indicators section of the AIHW's Mental health services in Australia website. It is also equivalent to the Key Performance Indicators for Australian Public Mental Health Services: MHS PI 12 —

Rates of post-discharge community care (which this new indicator is based on) and the Fourth National Mental Health Plan: NMHP PI 16 — Rates of post-discharge community care.

Clarification of the scope of the separations data was made to the 2012-13 data specification, however, jurisdictions advised that the impact on the overall data is likely to be minimal. Therefore, data are considered comparable across years in terms of the definitions

Queensland and WA have provided updated data for 2011-12 and 2012-13, thus these data have been updated and resupplied in this reporting cycle.

For public sector community mental health services, Victorian data are unavailable (for 2011-12 and 2012-13) due to service level collection gaps resulting from protected industrial action during this period.

Industrial action during the 2011-12 and 2012-13 collection periods in Tasmania has limited the available data quality and quantity of community data. Australian totals for 2011-12 and 2012-13 should therefore be interpreted with caution.

For 2012-13, the ACT has refined its calculation methodology and as such, comparisons to previous years' results should be viewed with caution.

Source systems vary in terms of whether location data for the patients usual address is SA2 versus postcode.

All jurisdictions have used the same concordance and proportionally allocated records to remoteness and SEIFA categories.

Accessibility

These data are published in the:

- RoGS available at: www.pc.gov.au/rogs.
- Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Interpretability

Definitions for this indicator are published in the indicator specifications in METeOR.

Data Gaps/Issues Analysis

Key data gaps/issues

- States and territories vary in their capacity to accurately track post-discharge follow-up between hospital and community service organisations, due to the lack of unique patient identifiers or data matching systems.
- For public sector community mental health services, Victorian data are unavailable (for 2011-12 and 2012-13) due to service level collection gaps resulting from protected industrial action during this period. Industrial action during the 2011-12 and 2012-13 collection periods in Tasmania has limited the available data quality and quantity of community data. Australian totals for 2011-12 and 2012-13 should therefore be interpreted with caution.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.
- SEIFA data for 2011-12 are not directly comparable with SEIFA for 2012-13 or 2013-14.

Readmissions to hospital within 28 days of discharge

DQI for this indicator has been sourced from state and territory health authorities and AIHW with additional Steering Committee comments.

Indicator definition and description

Element Quality— continuity

Indicator Readmissions to hospital within 28 days of discharge

Measure (computation)

Description:

Proportion of 'in-scope' admitted patient overnight separations from public psychiatric acute inpatient services that were followed by readmission to public psychiatric acute

inpatient services within 28 days of discharge.

Numerator:

Number of 'in-scope' admitted patient overnight separations from public psychiatric acute inpatient services that were followed by readmission to public psychiatric acute inpatient services within 28 days of discharge.

Denominator:

Number of 'in-scope' admitted patient overnight separations from public psychiatric acute inpatient services.

Computation:

Expressed as a proportion: (Numerator ÷ Denominator)*100.

Data source/s State and territory governments APMHC data set.

Data Quality Framework Dimensions

Institutional environment

The AIHW calculated the indicator based on data supplied by state and territory health authorities. The state and territory health authorities receive these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting.

Public hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

Estimates are based on all 'in scope' overnight separations from state and territory psychiatric acute inpatient units, where 'in scope' is defined as those separations for which it is meaningful to examine readmission after 28 days of discharge rates. The following separations were excluded: same day separations, including index separation and subsequent readmission; statistical and change of care type separations; separations that end by transfer to another acute or psychiatric hospital; separations that end by death, or instances where the person left against medical advice or discharged at own risk, separations where the length of stay is one night only and a procedure code for ECT is recorded.

A readmission for any of the separations identified as 'in-scope' is an admission to any other public acute psychiatric unit within the jurisdiction. For this to occur a system of unique client identifiers needs to be in place that allows individuals to be 'tracked' across units. Such systems have been available in all states/territories for the full period (2005-06 to 2013-14), with the exception of Tasmania (which introduced such a system in 2007-08) and SA (which has not yet introduced such a system).

Readmissions across state and territory boundaries or movements between public and private hospitals are not captured.

No distinction is made between planned and unplanned readmissions because data collection systems in most Australian public mental health services do not include a reliable or consistent method to distinguish a planned from an unplanned admission to hospital.

Remoteness and socioeconomic status have been allocated using the client's usual residence, not the location of the service provider. State/territory is reported for the

state/territory of the service provider.

Timeliness

State and territory health authorities provide these data to Department of Health for national collation, on an annual basis approximately twelve months after the reference period.

The latest year of data available is 2013-14.

Accuracy

Coverage of the 'in-scope' separations and readmissions is essentially complete across jurisdictions and years.

States and territories are primarily responsible for the quality of these data. The AIHW analyses the data, but cannot independently verify them.

SA was limited in their ability to accurately identify unique consumers due to lack of a unique patient identifier. Consequently the result may appear lower than it actually is, as missing or inaccurate linking data between the separate data sets means that some relevant re-admissions may not be identified.

For SA, exclusion criteria based on separation end mode have been applied to the index separation only. Same-day separations and separations where length of stay is one night only with ECT procedure recorded are excluded from both index and readmission episode/separations..

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

Coherence

Data are available from 2005-06 to 2013-14. There has been no major change to the method used to collect the data or to derive the results across years for the majority of jurisdictions, therefore the data are largely comparable across most jurisdictions and years.

States and territories differ in their capacity to accurately track clients across organisations or service types, this can affect the comparability of the results across jurisdictions (see the relevance and accuracy dimensions).

For WA, changes in historical data are due to a change in methodology which has resulted in additional records being selected and used for calculating readmission; hence rates are slightly higher than previously reported.'

An absence of a state-wide unique patient identifier in WA means there is a reliance on data linkage which uses probabilistic matching. Data is preliminary and is subject to change.

For data before 2012-13, states and territories differed in the overnight separations that they count as 'in scope'. NSW and Queensland excluded separations where length of stay is one night only and the procedure code for ECT is recorded and the ACT excluded all overnight separations with the procedure code for ECT, whereas the others (Victoria, WA, SA, Tasmania and the NT) included all overnight separations for the procedure code for ECT.

From 2012-13, the exclusion of overnight stays of one night with an ECT procedure code became a business rule for the calculation of data for this indicator. The change was considered likely to be minimal, therefore, historical data updates were not considered mandatory. The change is also unlikely to alter the interpretability of long term data trends.

Queensland applies in-scope filtering to the subsequent readmission that matches the counterpart in-scope filter for index separations. For example, as outlined above, separations that end by transfer to another acute or psychiatric hospital separations are excluded from the denominator (index separation). By the same token, for the subsequent readmission, Queensland excludes separations that are commenced with code indicating they commenced with transfer from another acute or psychiatric hospital. However, these separations may be eligible for consideration as separate index separation if they did not end with a transfer to another facility.

From 2012-13, the ACT refined its calculation methodology and as such, comparisons to previous years' results should be viewed with caution.

Accessibility

These data are also published in the:

COAG national action plan on mental health progress reports available at

- www.coag.gov.au
- National mental health reports available at www.health.gov.au/internet/ main/publishing.nsf/Content/mental-data
- Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Interpretability

Data Gaps/Issues Analysis

Key data gaps/issues

- No distinction is made between planned and unplanned readmissions.
- States and territories differ in their capacity to accurately track clients across organisations or service types.
- States and territories differ in the overnight separations that they count as 'in scope'.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Cost of inpatient care — average recurrent cost per inpatient bed day

DQI for this indicator has been sourced from the AIHW and state and territory health authorities, with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Cost for inpatient care — average recurrent cost per inpatient bed day

Measure <u>Description:</u>

(computation) Average recurrent cost per inpatient bed day.

Numerator:

Expenditure on State and Territory funded specialised mental health admitted patient services, by hospital and program type and by target population and program type.

Denominator:

Number of inpatient bed days in State and Territory funded specialised mental health admitted patient services, by hospital and program type and by target population and program type.

Disaggregations for numerator and denominator are:

By inpatient target population:

- · general, by acute and non-acute
- · child and adolescent, by acute and non-acute
- · older persons' psychiatry, by acute and non-acute
- · forensic psychiatry, by acute and non-acute

By hospital type:

- psychiatric hospitals, by acute units and non-acute units
- public acute hospital with a psychiatric unit or ward, by acute and non-acute units

Computation:

Expressed as \$ per bed day. Calculation is Numerator/Denominator.

Real expenditure is reported across years. The general formula for applying the deflator (used in the attachment tables) to convert nominal dollars to real dollars is:

$$R_t = \frac{D_t}{N_t} \times 100$$

Where:

 \mathbf{R}_{t} is real dollars in year t

 \mathbf{D}_{t} is nominal dollars in year t

 N_t is the new index based in year t. N_t is sourced from ABS unpublished, government final consumption expenditure on hospitals and nursing homes price deflator for 2013-14 dollars (2013-14=100).

Data source/s

Numerator and Denominator: AIHW from the MHE NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator. The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state

and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes). Specialised psychiatric care in non-specialised public mental health inpatient units is not in scope of the MHE NMDS.

Bed days include those for same day admissions, which are counted as one day. Leave days are excluded. Same day admissions are a confounding issue that require the identification of intent of admission (that is, day care or overnight stay). Leave days also present complexities in the mental health area and further work is required to ensure that it does not distort this indicator.

Expenditure data are for services provided in specialised mental health service units in public psychiatric hospitals, public acute hospitals and publicly funded private hospital units. Expenditure comprises direct and indirect expenditure incurred at the individual service unit level. Some indirect expenditure reported at the organisational and regional level can be directly linked to the provision of services by service units and is apportioned to individual service units. The residual indirect expenditure incurred at the state and territory level and that unapportioned from the organisational or regional level is not included in the estimates.

Cost per inpatient bed day data are not adjusted for differences in the client mix. The client mix in inpatient settings can differ — for example, some jurisdictions treat a higher proportion of less complex patients in inpatient settings as distinct from treating them in the community. More relevant measures would be casemix adjusted, for which cost is adjusted to take into account the type and complexity of cases. Data for these measures are not yet available, as casemix funding has not been applied to specialised mental health services.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation on an annual basis, approximately nine months after the reference period. The reference period for the most recent data is 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope mental health services for expenditure and bed days is essentially complete across jurisdictions and years.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AlHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AlHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AlHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AlHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2011-12 data could differ from previous reports.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

Coherence

Data are reported for each year from 2005-06 to 2013-14. Data should be reported

consistently across most jurisdiction and across years within most jurisdictions.

Costs per inpatient bed day may not be comparable across jurisdictions. Classification of expenditure into target populations and program type is based on the classification of services as reported to the MHE NMDS rather than the characteristics of their patient populations. For a service to be classified as providing a child and adolescent, older persons' or forensic mental health service for example, it must be recognised by the relevant state or territory funding authority as having a corresponding specialised function and is specifically funded to provide such specialty services. It is likely that the cost per patient day for general mental health services in a jurisdiction that has separate child and adolescent and older persons services (for example, NSW and Victoria), may not be comparable to the average cost in a jurisdiction that has general services only (for example, NT).

For NSW, CADE residential mental health services were reclassified as admitted patient hospital services from 1 July 2007. All data relating to these services have been reclassified from 2007-08 onwards, including expenditure. Comparison of NSW data over time therefore should be approached with caution.

Caution is required when interpreting historical Queensland data, particularly as several services reported as forensic up to 2008-09 were reclassified as general services in 2009-10 to more accurately reflect the function of these services. For 2010-11 and 2011-12, a small number of Youth services have been included in the General category at the request of Queensland. Queensland public acute hospital data includes costs associated with extended treatment services (campus and non-campus based) reported as non-acute admitted patient services in public acute hospitals. Queensland does not provide any acute services in public psychiatric hospitals. Additionally, Queensland provides older persons' mental health inpatient services using a number of different service models, however the majority of older persons' acute care is reported through general adult units, which limits comparability with jurisdictions that report these services differently. Queensland does not report any acute forensic services, however forensic patients can and do access acute care through general units.

From 2010-11, a small number of Youth services have been included in the General category at the request of Queensland.

For WA data, a review of services resulted in the reclassification of beds between the acute and non-acute categories for the 2010-11 collection, to more accurately reflect the function of these services.

For SA, any increases in admitted patient expenditure in 2013-14 partly relate to genuine increases in mental health services. However, a significant proportion of the increases relate to improved identification and allocation of direct care and general overhead expenditure to mental health services.

ACT average costs for older person's mental health services during 2006-07 are based on a new 20 bed unit opened in March 2007, in which only 6–10 beds operated due to issues related to staffing resources. This has artificially inflated the average cost of older persons' mental health services relative to other jurisdictions and other years for the ACT.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports
- the Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Interpretability

Metadata information for the MHE NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Further information to understand this indicator are available:

 in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition • from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

- The average recurrent cost per inpatient bed day measures are not adjusted for differences in the client mix and this reduces the relevance of these data to the measurement of efficiency.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Cost of inpatient care — average length of inpatient stay

DQI for this indicator has been sourced from the AIHW and state and territory health authorities, with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Cost of inpatient care — average length of inpatient stay

Measure <u>Description:</u>

(computation) Average length of inpatient stay in acute units, by target population.

Numerator:

Number of inpatient bed days in State and Territory funded specialised mental health admitted patient acute units, by target population.

Denominator:

Number of separations from State and Territory funded specialised mental health admitted patient acute units, by target population.

Disaggregations for numerator and denominator are:

By inpatient target population:

- general acute
- child and adolescent acute
- · older persons' psychiatry acute
- total acute (excluding forensic)

Computation:

Expressed as number of days per stay. Calculation is Numerator/Denominator.

Data source/s Numerator and Denominator: AIHW from the MHE NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes). Specialised psychiatric care in non-specialised public mental health inpatient units is not in scope of the MHE NMDS.

Bed days include those for same day admissions, which are counted as one day. Leave days are excluded. Same day admissions are a confounding issue that require the identification of intent of admission (that is, day care or overnight stay). Leave days also present complexities in the mental health area and further work is required to ensure

that it does not distort this indicator.

Average length of stay data are not adjusted for differences in the client mix. The client mix in inpatient settings can differ — for example, some jurisdictions treat a higher proportion of less complex patients in inpatient settings as distinct from treating them in the community. More relevant measures would be relative stay index, for which the length of stay index takes into account the type and complexity of cases. Data for these measures are not yet available, as casemix analysis has not been applied to specialised mental health services.

Patients days for clients who separated in the reference period that were during the previous period (for example, 2009-10), are excluded. Patient days for clients who remain in hospital (that is, are not included in the separations data) are included.

Average length of stay is not calculated for forensic services as the length of stay is determined by factors outside the control of the specialised mental health service. However, the child and adolescent and older persons' psychiatry target population services may include a forensic component.

Average length of stay is not calculated for non-acute inpatient units due to variability across jurisdictions in the models and mix of care (in particular, variability across jurisdiction in mix of non-acute inpatient and community-based residential care units) that would significantly affect the comparability of the average length of stay data.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation on an annual basis, approximately nine months after the reference period. The reference period for the most recent data are 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope mental health services bed days and separations is essentially complete across jurisdictions.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AlHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AlHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AlHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AlHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

The quality of the separations data used to derive this indicator is variable across jurisdictions. Until recently, these separations data were not subject to the level of in depth scrutiny that has applied to other data elements in the MHE NMDS. Therefore, data are only available from 2010-11. It is expected that the quality of these data will improve over time.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

Coherence

Average length of stay data may not be comparable across jurisdictions. Classification of inpatient days and separations into target populations and program type is based on the classification of services as reported to the MHE NMDS rather than the characteristics of their patient populations. For a service to be classified as providing a child and adolescent, older persons' or forensic mental health service for example, it must be recognised by the relevant state or territory funding authority as having a corresponding specialised function and is specifically funded to provide such specialty services. It is likely that the average length of stay for a general mental health services in a jurisdiction that has separate child and adolescent and older persons services (for example, NSW and Victoria) may not be comparable to the average length of stay that has general services only (for example, NT).

Queensland provides older persons' mental health inpatient services using a number of different service models, however the majority of older persons' acute care is reported through general adult units, which limits comparability with jurisdictions that report these

services differently.'

A small number of Youth services have been included in the General category at the request of Queensland.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports
- the Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Interpretability

Metadata information for the MHE NMDS are published in the AlHW's online metadata repository — METeOR and in the National health data dictionary.

Further information to understand this indicator are available:

- in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition
- from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

- The average length of stay measures are not adjusted for differences in the client mix and this reduces the relevance of these data to the measurement of efficiency.
- The quality of the separations data used to derive this indicator is variable across jurisdictions.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Cost of community-based residential care

DQI for this indicator has been sourced from the AIHW and state and territory health authorities with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Cost of community-based residential care

Measure <u>Description:</u>

(computation) Average recurrent cost per patient day for community-based residential care

Numerator:

Expenditure on community-based residential care, by target population and staffing

provided

Denominator:

Number of patient days in community-based residential care, by target population and

staffing provided.

Disaggregations for the numerator and denominator are:

General adult units

24 hour staffed

Non-24 hour staffed

Older people's care units

24 hour staffed

Non-24 hour staffed

Computation:

Expressed as \$ per bed day. Calculation is Numerator/Denominator.

Real expenditure is reported across years. The general formula for applying the deflator (used in the attachment tables) to convert nominal dollars to real dollars is:

$$R_t = \frac{D_t}{N_t} \times 100$$

Where:

R, is real dollars in year t

 $D_{\it t}$ is nominal dollars in year t

 N_t is the new index based in year t. N_t is sourced from ABS unpublished, government final consumption expenditure on hospitals and nursing homes price deflator for 2013-14 dollars (2013-14=100).

Data source/s Numerator and Denominator: AIHW from the MHE NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory

and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes).

Patient days and expenditure relating to community residential services includes that for publicly funded residential services operated by non-government organisations.

Expenditure data are for services provided in community residential units. Expenditure comprises direct and indirect expenditure incurred at the individual service unit level. Some indirect expenditure reported at the organisational and regional level can be directly linked to the provision of services by service units and is apportioned to individual service units. The residual indirect expenditure incurred at the state and territory level and that unapportioned from the organisational or regional level is not included in the estimates.

Cost per patient day data are not adjusted for differences in the client mix. The client mix in community residential settings can differ — for example, some jurisdictions treat a higher proportion of more complex patients in community residential services. More relevant measures would be casemix adjusted to take into account the type and complexity of cases. Data for these measures are not yet available, as casemix funding has not been applied to specialised mental health services.

Data for child and adolescent community-based residential units are included in the data for general acute units for NSW and the ACT. Other jurisdictions do not have these types of units.

For 2011-12, a small number of Youth services have been included in the General category at the request of WA. From 2012-13, a small number of Youth services have been included in the General category at the request of Victoria, WA and the ACT.

Queensland does not report any in-scope government-operated residential mental health services to the MHE NMDS. However, it funds a number of extended treatment services (campus and non-campus based) with full clinical staffing for 24 hours a day, 7 days a week that are reported as non-acute admitted patient services.

From 2013-14. a small number of residential services reported by SA and the NT as Forensic were included in the General category at the request of those jurisdictions.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation on an annual basis, approximately nine months after the reference period. The reference period for the most recent data are 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope mental health services community residential expenditure and bed days is complete across jurisdictions and years.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AIHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AIHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AIHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year. Delays caused by this change in completing the NSW 2010-11 MHE NMDS has also meant that the figures provided for the RoGS have not completed full validation and may be different to the finalised data that will be provided for the *National Mental Health Report*.

Coherence

Data are reported for each year from 2005-06 to 2013-14. Data should be reported consistently across years within most jurisdictions.

Classification of expenditure and inpatient days into target populations is based on the classification of services as reported to the MHE NMDS rather than the characteristics of their patient populations. For a service to be classified as providing a general or older persons' mental health service, it must be recognised by the relevant state or territory funding authority as having a corresponding specialised function and is specifically funded to provide such specialty services. For NSW and the ACT, some child and adolescent services are reclassified to general adult to protect agency confidentiality.

For NSW, CADE residential mental health services were reclassified as admitted patient hospital services from 1 July 2007. All data relating to these services have been reclassified from 2007-08 onwards, including patient days. Comparison of NSW data over time therefore should be approached with caution.

Several WA residential services reported as 24-hour staffed services in 2009-10 transitioned to a non-24-hour staffed model of care as of 1 July 2010.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports.

Interpretability

Metadata information for the MHE NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

- The cost of community-based residential care measures are not adjusted for differences in the client mix and this reduces the relevance of these data to the measurement of efficiency.
- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.

Cost of ambulatory care

DQI for this indicator has been sourced from the AIHW, state and territory health authorities and Department of Health with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Cost of ambulatory care

Measure Description:

(computation) Average treatment days per episode of ambulatory care.

Average cost per treatment day of ambulatory care

Numerator:

(1) Number of treatment days in ambulatory care.

(2) Adjusted recurrent expenditure on ambulatory care.

Denominator:

(1) Number of statistical episodes of ambulatory care.

(2) Number of treatment days in ambulatory care.

Computation:

Expressed as treatment days per episode OR cost per episode. Calculation is

Numerator (1 OR 2)/Denominator (1 OR 2).

Data source/s Numerator (1): AIHW from the CMHC NMDS.

Numerator (2): AIHW from the MHE NMDS

Denominator/s: AIHW from the CMHC NMDS.

Data Quality Framework Dimensions

Institutional environment

The AIHW has provided the data for this indicator.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister for Health. For further information see the AIHW website.

The data were supplied to the AIHW by state and territory health authorities. The state and territory health authorities received these data from specialised mental health organisations/units in psychiatric and acute hospitals, and community-based ambulatory and residential settings. States and territories use these data for service planning, monitoring and internal and public reporting. Organisations may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

States and territories supplied these data under the auspices of the National Healthcare Agreement and the terms of the National Health Information Agreement.

Relevance

The scope of the MHE NMDS is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities. The purpose of the MHE NMDS is to collect information on the characteristics of specialised mental health services (for example, program type and target populations) and summary information on their expenditure, staffing and activity (for example, patient days, available beds, separations, contact and episodes). Ambulatory services managed by non-government organisations are not defined as statistical units for the MHE NMDS and therefore excluded.

The scope of the CMHC NMDS is government-operated community (also termed ambulatory) mental health services. Data collected includes information relating to each individual service contact provided by an in-scope mental health service. Examples of data elements are demographic characteristics of patients, such as age and sex, clinical information, such as principal diagnosis and mental health legal status, and service

provision information, such as contact duration and session type. Ambulatory services managed by

non-government organisations are not considered in-scope for the CMHC NMDS and are therefore excluded.

All activity (treatment days and statistical episodes) and expenditure associated with non-uniquely identified consumers is excluded.

Expenditure data are for services provided in public specialised mental health ambulatory services. Expenditure comprises direct and indirect expenditure incurred at the individual service unit level. Some indirect expenditure reported at the organisational and regional level can be directly linked to the provision of services by service units and is apportioned to individual service units. The residual indirect expenditure incurred at the state and territory level and that unapportioned from the organisational or regional level is not included in the estimates.

Treatment days per episode or expenditure per treatment day are not adjusted for differences in the client mix. The client mix in ambulatory settings can differ — for example, some jurisdictions treat a higher proportion of more complex patients in ambulatory settings as distinct from treating them in hospitals. More relevant measures would be casemix adjusted to take into account the type and complexity of cases. Data for these measures are not yet available, as casemix funding/analysis has not been applied to specialised mental health services.

Treatment day refers to any day on which one or more community contacts (direct or indirect) are recorded for a registered client during an ambulatory care episode. 'One treatment day' episodes are included. These episodes are a confounding issue and a method for accounting for 'one treatment day' ambulatory episodes might provide more relevant measures.

An episode of ambulatory care is a three month period of ambulatory care for an individual registered patient where the patient was under 'active care' (one or more treatment days in the period). Community-based periods relate to the following four fixed three monthly periods: January to March, April to June, July to September, and October to December. The three month period used in this indicator to define a treatment episode is arbitrary. Further development of episode-based funding models may enable more meaningful/relevant measures in future.

Data are not available for Victoria for 2012-13. All Australian totals for 2012-13 exclude Victoria.

Industrial action in Tasmania in 2011-12 and 2012-13 affected the quality and quantity of Tasmania's CMHC data.

Timeliness

State and territory health authorities provide the MHE NMDS data to the AIHW for national collation on an annual basis, approximately nine months after the reference period.

State and territory health authorities provide the CMHC NMDS data to the AIHW for national collation on an annual basis, approximately six months after the reference period.

The reference period for the most recent data are 2013-14.

Accuracy

Coverage of the MHE NMDS in-scope expenditure is essentially complete across years. Coverage of the CMHC NMDS in-scope mental health services contacts is variable among the jurisdictions, with coverage issues for both the services in-scope for collection and the reporting of service contacts between clinicians and clients. Work is ongoing to clarify coverage for jurisdictions.

States and territories are primarily responsible for the quality of the MHE NMDS data they provide. However, the Department of Health and the AIHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is overseen by the Department of Health and managed by the AIHW and is concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is managed by the AIHW and is primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues, including invalid values, missing data and historical inconsistency. Potential validation errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not

adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

States and territories are primarily responsible for the quality of the CMHC NMDS data they provide. However, the AIHW undertake extensive validation. Validation is conducted in two stages: (1) The compliance stage is concerned with ensuring that the data file supplied is structurally compliant and correctly formatted. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage is series of edit checks to ensure that the data supplied are consistent, logical and with valid values. Potential validation errors are queried with jurisdictions, and where the priority for correction is considered high, resubmissions are requested in response to these edit queries. A series of additional edit checks are conducted by the AIHW including coverage checks, historical validation and state/territory comparisons. The AIHW does not adjust data to account for possible data errors or missing or incorrect values. Jurisdictions are responsible for adjusting any data that is identified as problematic and re-submitting improved data files.

Data are also subject to ongoing historical validation. Due to this ongoing validation, 2005-06 to 2012-13 data could differ from previous reports.

The quality of the NSW 2010-11 MHE NMDS has been affected by the reconfiguration of 10 Area Health Services into 18 Local Health Districts mid the 2010-11 financial year.

Coherence

Data are reported for each year from 2005-06 to 2013-14.

Non-uniquely identifiable consumers' are defined as those with service contacts for which a unique person identifier was not recorded. The proportion of contacts attributed to these consumers varies across jurisdictions (for example, from zero to 15 per cent) and can vary in one jurisdiction across time (for example, from 76 to 99 per cent). As all activity (treatment days and statistical episodes) and expenditure associated with non-uniquely identified consumers are excluded using these proportions, the coherence and comparability of the results across jurisdictions and across time may be affected.

The Australian totals for 2011-12 and 2012-13 are not comparable to other years as they exclude data for Victoria.

Accessibility

The AIHW and Department of Health provide a variety of products that draw upon the MHE NMDS. Published products available on the AIHW or Department of Health websites include:

- Mental Health Services in Australia annual publication
- Australia's Health a mental health chapter is included in this biennial publication
- National Mental Health Reports
- the Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

Unpublished MHE NMDS data are available from the AIHW on request, but clearance for use of these data for a specific purpose needs to be provided by states and territories and there may be costs incur in their provision. Cells may be suppressed for confidentiality reasons or where estimates are based on small numbers, resulting in low reliability.

Interpretability

Metadata information for the MHE NMDS are published in the AIHW's online metadata repository — METeOR and in the National health data dictionary.

Further information to understand this indicator are available:

- in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition
- from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

 The cost of ambulatory care measures are not adjusted for differences in the client mix and this reduces the relevance of these data to the measurement of efficiency.

- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.
- The exclusion of activity (treatment days and statistical episodes) and expenditure associated with non-uniquely identified consumers means that the coherence and comparability of the results across jurisdictions and across time may be affected.

Rates of illicit and licit drug use

DQI for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Rates of illicit and licit drug use

Measure (computation)

Description:

Proportion of people aged 14 years or over who use specific licit and illicit drugs in the preceding 12 months — by drug type: alcohol, cannabis, ecstasy, cocaine, meth/amphetamine, hallucinogens, Gamma-hydroxybutyrate (GHB), inhalants, and heroin

Numerator:

Number of people aged 14 years or over who use specific licit and illicit drugs in the preceding 12 months — by drug type.

Denominator:

Total population aged 14 years or over.

Computation:

(Numerator ÷ Denominator)*100

Calculated separately, by drug type.

Data source/s

AIHW 2014, National Drug Strategy Household Survey (NDSHS) detailed report 2013,

Drug statistics series no. 28, Cat. no. PHE 183, Canberra.

AIHW 2011, 2010 NDSHS Report, Drug statistics series no. 25, Cat. no. PHE 145.

Data Quality Framework Dimensions

Institutional environment

The NDSHS data were managed, analysed and published by the AIHW. The AIHW is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. The AIHW is an independent corporate Commonwealth entity within the Health portfolio, governed by a management Board, and accountable to the Australian Parliament through the Health and Ageing portfolio.

The NDSHS is one of the key data collections that support the *National Drug Strategy*. The last survey in this program was conducted in 2013, with previous surveys in 1985, 1988, 1991, 1993, 1995, 2001, 2004, 2007 and 2010. The data collected from these surveys have contributed to the development of policies for Australia's response to drug-related issues.

Relevance

Scope and coverage

The NDSHS collects self-reported information on tobacco, alcohol and illicit drug use and attitudes from persons aged 12 years and over.

Excluded from sampling were non-private dwellings (hotels, motels, boarding houses, etc.) and institutional settings (hospitals, nursing homes, other clinical settings such as drug and alcohol rehabilitation centres, prisons, military establishments and university halls of residence). Homeless persons were also excluded as well as the territories of Jervis Bay, Christmas Island and Cocos Island.

The exclusion of people from non-private dwellings and institutional settings, and the difficulty in reaching marginalised people are likely to have affected estimates.

The 2013 NDSHS was designed to provide reliable estimates at the national level. The survey was not specifically designed to obtain reliable national estimates for Aboriginal and Torres Strait Islander people, as there was no target sample size for Aboriginal and Torres Strait Islander Australians. In 2013, the sample size for Aboriginal and Torres

Strait Islander Australians was smaller than anticipated based on population estimates, and so estimates based on this population group should be interpreted with caution.

Reference period

The fieldwork was conducted from 31 July to 1 December 2013. Respondents to the survey were asked questions relating to their beliefs and experiences covering differing time periods, predominantly over the previous 12 months.

Geographic detail

In 2013, data were coded to the census collector's district level. Data are generally published at the national level with a selection of data published at the State/Territory and Remoteness Area levels.

Statistical standards

Data on alcohol consumption was collected in accordance with World Health Organization standards and alcohol risk data were reported in accordance with the current 2009 National Health and Medical Research Council's 'Australian Guidelines to Reduce Health Risks from Drinking Alcohol'.

Timeliness

The NDSHS is conducted approximately every three years over a three-four month period. 2013 data were collected between late-July and early December 2013.

A preliminary data set was received by the AIHW in late-January 2014 and initial data checks were completed in early February 2014.

Key findings from the 2013 NDSHS were released on 17 July 2014.

Accuracy

Perceptions of behaviour

It is known from past studies of alcohol consumption that respondents tend to underestimate actual consumption levels (Stockwell et al. 2004). There are no equivalent data on the tendencies for under- or over-reporting of actual illicit drug use.

However, illicit drug users, by definition, have committed illegal acts. They are, in part, marginalised and difficult to reach. Accordingly, estimates of illicit drug use and related behaviours are likely to be underestimates of actual practice

Sample design

The 2013 sample was stratified by region (15 strata in total — capital city and rest of state for each state and territory, with the exception of the ACT, which operated as one stratum). To produce reliable estimates for the smaller states and territories, sample sizes were boosted in Tasmania. the ACT and the NT.

The over-sampling of lesser populated states and territories produced a sample that was not proportional to the state/territory distribution of the Australian population aged 12 years or older. Weighting was applied to adjust for imbalances arising from execution of the sampling and differential response rates, and to ensure that the results relate to the Australian population.

Sampling error

The measure used to indicate reliability of individual estimates reported in 2013 was the relative standard error (RSE). Only estimates with RSEs of less than 25 per cent are considered sufficiently reliable for most purposes. Results subject to RSEs of between 25 per cent and 50 per cent should be considered with caution and those with RSEs greater than 50 per cent should be considered as unreliable for most practical purposes.

Non-sampling error

In addition to sampling errors, the estimates are subject to non-sampling errors. These can arise from errors in reporting of responses (for example, failure of respondents' memories, incorrect completion of the survey form), the unwillingness of respondents to reveal their true responses and the higher levels of non-response from certain subgroups of the population.

Reported findings are based on self-reported data and not empirically verified by blood tests or other screening measures.

Response rates and contact rates

Overall for the 2013 Survey, contact was made with 48 579 in-scope households, of which 23 855 questionnaires were categorised as being complete and useable, representing a response rate for the 2010 survey of 49.1 per cent, slightly lower than the drop and collect component of the 2010 survey (50.6 per cent).

Some survey respondents did not answer all questions, either because they were unable or unwilling to provide a response. The survey responses for these people were retained in the sample, and the missing values were recorded as not answered. No attempt was made to deduce or impute these missing values.

A low response rate does not necessarily mean that the results are biased. As long as the non-respondents are not systematically different in terms of how they would have answered the questions, there is no bias. Given the nature of the topics in this survey, some non-response bias is expected. If non-response bias in the NDSHS is to be eliminated as far as possible, there would need to be additional work conducted to investigate the demographic profile of the non-respondents and the answers they may have given had they chosen to respond.

Aboriginal and Torres Strait Islander Data

The survey was not specifically designed to obtain reliable national estimates for Aboriginal and Torres Strait Islander people, as there was no target sample size for Indigenous Australians. In the 2013 NDSHS, 1.9 per cent of the sample (or approximately 461 respondents) identified as being of Aboriginal or Torres Strait Islander origin. The sample size for Indigenous Australians was smaller than anticipated based on population estimates, and so estimates based on this population group should be interpreted with caution.

The total population of Aboriginal and Torres Strait Islander people forms a very small part of the total Australian population. At the August 2011 census, the Aboriginal and Torres Strait Islander population was officially calculated at 670,000 people, or 2.1 per cent of the total Australian population. At that time, about one-third (35 per cent) of the Aboriginal and Torres Strait Islander population lived in Major cities, 22 per cent in Inner regional areas, 22 per cent in Outer regional areas, 8% in Remote areas and 14 per cent in Very remote areas.

The Aboriginal and Torres Strait Islander population living in Very remote areas shows other differences to populations living in Major cities including in household structure, size and age distribution. The NDSHS sample design is stratified by region and not by remoteness. Due to this sampling design, the NDSHS sample of Indigenous Australians living in Very remote areas comprised of 9 per cent of the population in those regions compared with 14 per cent of Indigenous Australians living in Very remote areas based on the 2011 Census. Therefore, Aboriginal and Torres Strait Islander people in Very remote areas are underrepresented, and it becomes difficult to generalise results from Major cities and regional areas to the whole Indigenous population.

The sampling method employed for the NDSHS invited one participant aged over 12 years to take part in the survey. The sample strategy did not take into account the size of the household selected. This is an issue for respondent selection for Indigenous Australians, as often they live in larger households compared with non-Indigenous Australians. This selection process means that Aboriginal and Torres Strait Islander people are proportionately less likely to be selected.

The NDSHS uses a self-completion questionnaire, and requires good comprehension of the English language (as it is not translated into other languages) and the ability to follow instructions. Practicality of the survey design meant that some Aboriginal communities and those with low levels of English literacy may have been excluded. Response rates are reported in the relevant NDSHS reports.

Coherence

Surveys in this series commenced in 1985. Over time, modifications have been made to the survey's methodology and questionnaire design. The 2013 survey differs from previous versions of the survey in some of the questions asked and also used three follow-up attempts by interviewers instead of the two used in 2010.

Methodology

The 2013 survey was the second to exclusively use the drop and collect method, the first being 2010. In 2007 and 2004, a combination of computer-assisted telephone interviews (CATI) and drop and collect methods were used, and in earlier waves,

personal interviews were also conducted.

The change in methodology in 2010 does have some impact on time series data, and users should exercise some degree of caution when comparing data over time.

Fieldwork was conducted between July and December 2013, slightly later than in previous wave. The collection period also coincided with the 2013 federal election, although no questionnaires were placed on that day.

Sample

To produce reliable estimates for the smaller states and territories, sample sizes were boosted in Tasmania, the ACT and the NT.

In 2013 and 2010, to improve the geographic coverage of the survey, interviewers were flown to Very remote areas selected in the sample. In previous surveys, some Very remote areas that were initially selected in the sample would have been deemed inaccessible and not included in the final sample.

Questionnaire

The 2013 questionnaire was modelled on the 2010 version, to maintain maximum comparability. However, some refinements were made to ensure the questions remained relevant and useful. For more information on questionnaire changes in 2013 see chapter 1 of the 2013 NDSHS report.

Accessibility

Results from the 2013 NDSHS are available on the AlHW website. Key findings can be found in the web compendium: Highlights from the 2013 survey and full published results can be found in the 2013 NDSHS report.

Users can request data not available online or in form the AIHW. Requests that take longer than half an hour to compile are charged for on a cost-recovery basis.

A confidentialised unit record file is available for third party analysis through the Australian Data Archive. Access to the master unit record file may be requested through the AIHW Ethics Committee.

Data for this indicator are also reported in the National mental health reports www.health.gov.au/internet/main/publishing.nsf/Content/mental-data

Interpretability

Information to aid in interpretation of 2013 NDSHS results may be found in chapter 1 of the 2013 NDSHS report titled 'Introduction'. In addition, the 2013 Technical Report, code book and other supporting documentation are available through the Australian Data Archive website or may be requested from AIHW

Further information to understand this indicator are available in:

- the COAG national action plan on mental health progress report 2010-11
- National mental health reports www.health.gov.au/internet/main/ publishing.nsf/Content/mental-data.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Respondents tend to underestimate actual alcohol consumption levels.
- Estimates of illicit drug use are also likely to be underestimates of actual practice.
- Reported findings are based on self-reported data and are not independently verified.
- The response rate for the 2013 survey was 49.1 per cent. Some non-response bias is expected — this bias has not been measured

Prevalence of mental illness

DQI for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Prevalence of mental illness

Measure (computation)

Numerator.

Number of people aged 16–85 years who had a mental health disorder diagnosed by the World Mental Health Composite Interviewing Diagnostic Instrument (CIDI).

with symptoms in last 12 months.

Denominator.

Total population aged 16-85 years.

Computation:

(Numerator ÷ Denominator)*100

Disaggregated by disorder type and age or sex (national only), State and Territory,

by disorder type.

Data source/s

ABS unpublished, 2007 National Survey of Mental Health and Wellbeing (Cat. no.

4326.0).

Data Quality Framework Dimensions

Institutional environment

For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, see ABS Institutional Environment (available

www.abs.gov.au).

Relevance

The 2007 National Survey of Mental Health and Wellbeing (SMHWB) provides information about the prevalence of selected *high prevalence* mental disorders in the Australian population aged 16–85 years, the level of impairment associated with these disorders, physical conditions, and the use of health services, such as consultations with health practitioners or visits to hospital. The survey also provides information on the strength of social networks, caring responsibilities and a range of socio-economic and demographic characteristics.

The SMHWB was designed to provide prevalence estimates for the mental disorders that are considered to have the highest incidence rates in the population — anxiety disorders (such as social phobia), affective disorders (such as depression) and substance use disorders (such as harmful alcohol use). The SMHWB was not designed to measure the prevalence of all mental health conditions, therefore some severe mental disorders, such as schizophrenia, were not collected.

The SMHWB is based on an international survey instrument, the CIDI, developed by the World Health Organization (WHO) for use by participants in the World Mental Health Survey Initiative.

The 2007 survey was designed to provide data that were internationally comparable, rather than to provide comparisons with the 1997 survey. The survey was also designed to provide estimates of the prevalence of mental disorders at a national rather than a state/territory level.

Timeliness

The SMHWB was conducted in 1997 and 2007.

Results from the 2007 survey were released ten months after the completion of enumeration, in the publication *National Survey of Mental Health and Wellbeing: Summary of Results* (cat. no. 4326.0).

Accuracy

Estimates from the 2007 SMHWB are subject to sampling and non-sampling errors. The RSE is a measure of the size of the sampling error affecting an estimate; that

is, the error introduced by basing estimates on a sample of the population rather than the full population. Estimates should be considered with reference to their RSEs. Estimates with an RSE between 25 per cent and 50 per cent should be used with caution, and those with an RSE greater than 50 per cent are considered too unreliable for general use. Non-sampling errors are inaccuracies that occur because of imperfections in reporting by respondents and interviewers, as well as errors made in coding and processing the data.

The SMHWB was designed primarily to provide estimates at the national level. Due to the higher than expected non-response rate, RSEs were somewhat larger than originally designed. While broad estimates are available for the larger states, users should exercise caution when using estimates at this level due to relatively high sampling errors.

Coherence

The 2007 SMHWB was the second survey of this type conducted by the ABS, with the previous survey conducted in 1997. Care should be exercised when comparing data between surveys as there have been a number of changes to the scope, design, collection, methodology and content.

Supporting documentation released with the survey data can assist in understanding the relationships between data variables within the dataset and in comparisons with data from other sources.

Accessibility

The main products available from this survey are:

- National Survey of Mental Health and Wellbeing: Summary of Results, 2007 (Cat. no. 4326.0)
- National Survey of Mental Health and Wellbeing: Users' Guide, 2007 (Cat. no. 4327.0)
- Microdata: National Survey of Mental Health and Wellbeing, Basic and Expanded Confidentialised Unit Record Files, 2007 (Cat. no. 4326.0.30.001)
- Technical Manual: National Survey of Mental Health and Wellbeing, Confidentialised Unit Record Files (Cat. no. 4329.0).

Further information may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

The National Survey of Mental Health and Wellbeing: Summary of Results (Cat. no. 4326.0) includes explanatory material to aid the interpretation of the survey results. More detailed information is available in the National Survey of Mental Health and Wellbeing: Users' Guide (Cat. no. 4327.0).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- The SMHWB was designed to provide estimates at the national level. Broad
 estimates are available for the larger states, but users should exercise
 caution when using estimates at this level due to relatively high sampling
 errors
- The SMHWB was designed to provide prevalence estimates for the mental disorders that are considered to have the highest incidence rates in the population anxiety disorders (such as social phobia), affective disorders (such as depression) and substance use disorders (such as harmful alcohol use). It does not measure the prevalence of some severe mental disorders, such as schizophrenia (which are the mental illnesses most frequently treated by specialised public mental health services).

Mortality due to suicide

DQI for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Mortality due to suicide

Measure (computation)

Numerator:

Number of people who have died by suicide over the relevant reference period:

five year period (2008–2012)single reference year (2012)

Denominator.

ERP.

Computation:

(Numerator ÷ Denominator)*100 000

Expressed as crude, age-specific or age standardised rates.

Disaggregated by age and sex (national only), State and territory for all persons, young people (15–24 years), by geographical region and Indigenous status.

Data source/s

Numerator: ABS Causes of Death collection (Cat. no. 3303.0)

Denominator: ABS ERP (Cat. no. 3101.0); Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 1991 to 2021 (Cat. no. 3238.0); ASGC (Cat. no. 1216.0).

Data Quality Framework Dimensions

Institutional environment

Statistics presented in *Causes of Death, Australia, 2012* (Cat. no. 3303.0) are sourced from deaths registrations administered by the various state and territory Registrars of Births, Deaths and Marriages. It is a legal requirement of each state and territory that all deaths are registered. Information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred on a *Death Registration Form*. As part of the registration process, information on the cause of death is either supplied by the medical practitioner certifying the death on a *Medical Certificate of Cause of Death*, or supplied as a result of a coronial investigation.

Death records are provided electronically to the ABS by individual Registrars on a monthly basis. Each death record contains both demographic data and medical information from the *Medical Certificate of Cause of Death* where available. Information from coronial investigations are provided to the ABS through the National Coroners Information System (NCIS).

For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, see ABS Institutional Environment (available www.abs.gov.au).

Relevance

The ABS Causes of Death collection includes all deaths that occurred and were registered in Australia, including deaths of persons whose usual residence is overseas. Deaths of Australian residents that occurred outside Australia may be registered by individual Registrars, but are not included in ABS deaths or causes of death statistics.

From the 2007 reference year, the scope of the collection is:

- all deaths registered in Australia for the reference year and are received by the ABS by the end of the March quarter of the subsequent year; and
- deaths registered prior to the reference year but not previously received from

the Registrar nor included in any statistics reported for an earlier period.

For example, records received by the ABS during the March quarter of 2011 which were initially registered in 2010 or prior (but not forwarded to the ABS until 2011) are assigned to the 2010 reference year. Any registrations relating to 2010 which are received by the ABS after the end of the March 2011 quarter are assigned to the 2011 reference year.

Data in the Causes of Death collection include demographic items, as well as causes of death information, which is coded according to the International Classification of Diseases (ICD). ICD is the international standard classification for epidemiological purposes and is designed to promote international comparability in the collection, processing, classification, and presentation of causes of death statistics. The classification is used to classify diseases and causes of disease or injury as recorded on many types of medical records as well as death records. The ICD has been revised periodically to incorporate changes in the medical field. The 10th revision of ICD (ICD-10) has been used since 1997.

Non-Indigenous data from the Causes of Death collection do not include death registrations with a 'not stated' Indigenous status.

Timeliness

Causes of death data are published on an annual basis.

There is a focus on fitness for purpose when causes of death statistics are released. To meet user requirements for accurate causes of death data it is necessary to obtain information from other administrative sources before all information for the reference period is available (for example, information from finalisation of coronial proceedings to code an accurate cause of death). A balance therefore needs to be maintained between accuracy (completeness) of data and timeliness. ABS provides the data in a timely manner, ensuring that all coding possible can be undertaken with accuracy prior to publication.

In addition, to address the issues which arise through the publication of causes of death data for open coroners cases, these data are subject to a revisions process. This process enables the use of additional information relating to coroner certified deaths either 12 or 24 months after initial processing.

Accuracy

Information on causes of death is obtained from a complete enumeration of deaths registered during a specified period and are not subject to sampling error. However, deaths data sources are subject to non-sampling error which can arise from inaccuracies in collecting, recording and processing the data. Every effort is made to minimise non-sample error by working closely with data providers, running quality checks throughout the data processing cycle, training of processing staff, and efficient data processing procedures.

Causes of death data for 2006, 2007, 2008, 2009, 2010, 2011 and 2012 have been subject to revision. All coroner certified deaths registered after 1 January 2006 are subject to a revision process. This is a change from previous years where all ABS processing of causes of death data for a particular reference period was finalised approximately 13 months after the end of the reference period. Where insufficient information was available to code a cause of death (for example, a coroner certified death was yet to be finalised by the Coroner), less specific ICD codes were assigned as required by the ICD coding rules. The revision process enables the use of additional information relating to coroner certified deaths as it becomes available over time. This results in increased specificity of the assigned ICD-10 codes.

For this year's report, causes of death data for 2011, 2012 were updated as more information became available. Final data for 2006, 2007, 2008, 2009, 2010 and 2011, revised data for 2012 and preliminary data for 2013 have been published in the 2013 Causes of Death publication, released in March 2015. 2012 and 2013 causes of death will be revised in the 2014 Causes of Death publication due for release in 2016. Revisions will only affect coroner certified deaths, as further information becomes available to the ABS about the causes of these deaths. See Causes of Death, Australia (Cat. no. 3303.0).

Some rates are unreliable due to small numbers of deaths over the reference period. Resultant rates could be misleading for example where the non-Indigenous mortality rate is higher than the Aboriginal and Torres Strait Islander mortality rate. All rates for this indicator must be used with caution.

Non-Indigenous population estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Aboriginal and Torres Strait Islander population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practice.

The completeness or quality of older (unrevised) versus newer data (subject to a revisions process) can affect comparisons across time. The accuracy dimension contains information pertinent to coroner certified deaths affected by the revision process.

The ERPs used to derived rates differ across years and tables. Some are derived using ERPs based on the 2001 Census, 2006 Census or 2011 Census. See particular tables for details. Rates derived using ERPs based on different Censuses are not comparable.

Accessibility

Causes of death data are available in a variety of formats on the ABS website under the 3303.0 product family. ERP data are available in a variety of formats on the ABS website under the 3101.0 and 3201.0 product families. Further information on deaths and mortality may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

Information on how to interpret and use cause of death data are available from Explanatory Notes in *Causes of Death, Australia* (Cat. no. 3303.0).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issue:

 Causes of death data are subject to a revisions process. Final data for 2006, 2007, 2008, 2009, 2010 and 2011, revised data for 2012 and preliminary data for 2013 have been published in the 2013 Causes of Death publication. Data for 2012 and 2013 causes of death will be revised in 2016.

Social and economic inclusion of people with a mental illness participation in employment of working age population

DQI for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Social and economic inclusion of people with a mental illness — participation in

employment of working age population.

Measure (computation) Numerator:

Number of people aged 16-64 years who are employed (by mental health status)

Denominator:

Number of people aged 16-64 years in the population (by mental health status)

Computation:

(Numerator ÷ Denominator)*100

Note: People with a mental health condition are defined as having a self-reported mental or behavioural problem that has lasted for six months, or which the

respondent expects to last for six months or more.

Data source/s ABS unpublished, Australian Health Survey (AHS) 2011-13 (2011-12 National

Health Survey component).

Data Quality Framework Dimensions

Institutional environment The AHS was collected, processed, and published by the ABS. The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment at www.abs.gov.au.

Long-term health conditions described in this publication are classified to a Relevance

classification developed for use in the NHS (or variants of that classification), based on the ICD. The 2011-12 AHS collected data on self-reported mental and behavioural problems that have lasted for six months, or which the respondent expects to last for six months or more. Estimates for people with 'mental illness'

will differ to those that are derived under the SMHWB using the CIDI.

The definitions of employment, unemployment and the labour force are

consistent with those used in ABS labour force surveys.

Timeliness The AHS is conducted every three years over a 12 month period. Results from

the 2011-12 NHS component of the AHS were released in October 2012.

Accuracy The AHS is conducted in all States and Territories, excluding very remote areas

and discrete Aboriginal and Torres Strait Islander communities. Non-private dwellings such as hotels, motels, hospitals, nursing homes and short-stay caravan parks were also not included in the survey. The exclusion of persons usually residing in very remote areas and discrete Aboriginal and Torres Strait Islander communities has a small impact on estimates, except for the NT where such persons comprise around 25 per cent of the estimated resident population. The response rate for the 2011-12 NHS component was 85 per cent. Results are

weighted to account for non-response.

As it is drawn from a sample survey, the indicator is subject to sampling error. Sampling error occurs because only a small proportion of the population is used to produce estimates that represent the whole population. Sampling error can be reliably estimated as it is calculated based on the scientific methods used to design surveys. Rates should be considered with reference to their RSE. Estimates with RSEs between 25 per cent and 50 per cent should be used with caution. Estimates with RSEs greater than 50 per cent are generally considered too unreliable for general use. The attachment tables identify those estimates with RSEs between 25 per cent and 50 per cent.

For information on AHS survey design, see the Australian Health Survey: Users' Guide on the ABS website.

Coherence

The methods used to construct the indicator are consistent and comparable with other collections and with international practise.

Accessibility

See Australian Health Survey: First Results (cat. no. 4364.0.55.001) for an overview of results from the NHS component of the AHS. Other information from this survey is also available on request.

Further information may be available on request. The ABS observes strict confidentiality protocols as required by the *Census and Statistics Act (1905)*. This may restrict access to data at a very detailed level.

Interpretability

Information to aid interpretation of the data are available from the Australian Health Survey: Users' Guide on the ABS website.

Many health-related issues are closely associated with age; therefore data for this indicator have been age-standardised to the 2001 total Australian population to account for differences in the age structures of the States and Territories. Age standardised rates should be used to assess the relative differences between groups, not to infer the rates that actually exist in the population.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

 The AHS collects data on self-reported mental and behavioural problems that have lasted for six months, or which the respondent expects to last for six months or more. The data may not be as reliable as or comparable with the data collected under the SMHWB that uses a diagnostic tool to identify mental illnesses.

Social and economic inclusion of people with a mental illness participation in education and employment by young people

DQI for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Social and economic inclusion of people with a mental illness — participation in

education and employment by young people.

Measure (computation) Numerator:

Number of people aged 16-30 years who are employed and/or are enrolled for

study in a formal secondary or tertiary qualification (studying full or part-time) (by

mental health status).

Number of people in aged 16-30 years in the population (by mental health

status).

Computation:

Denominator.

(Numerator ÷ Denominator)*100

Note: People with a mental health condition are defined as having a self-reported mental and behavioural problems that have lasted for six months,

or which the respondent expects to last for six months or more.

Data source/s ABS unpublished, AHS 2011-13 (2011-12 National Health Survey component).

Data Quality Framework Dimensions

Institutional environment The AHS was collected, processed, and published by the ABS. The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

The AHS collects data on self-reported mental and behavioural problems
that have lasted for six months, or which the respondent expects to last for
six months or more. The data may not be as reliable as, or comparable
with, the data collected under the National Survey of Mental Health and
Wellbeing that uses a diagnostic tool to identify mental illnesses.

Mental health outcomes of consumers of specialised public mental health services

DQI for this indicator has been sourced from the AMHOCN and Australian, State and Territory governments with additional Steering Committee comments.

Indicator definition and description

Element Outcome

Indicator Mental health outcomes of consumers of specialised public mental health services.

This DQI should be considered in conjunction with DQI for Collection of information on

consumers' outcomes.

Measure (computation)

Description:

Proportion of people receiving care in specialised public mental health services who had a significant improvement in their clinical mental health outcomes. Data are also reported on the proportion who experienced no significant change or a significant deterioration in their mental health outcomes. Data are reported by consumer type: people in ongoing community-based care, people discharged from community-based care and people discharged from a hospital psychiatric inpatient unit.

Numerator/s:

Number of people receiving care in specialised public mental health services who had <u>a significant improvement</u> in their clinical mental health outcomes, by consumer type.

Number of people receiving care in specialised public mental health services who had <u>no significant change</u> in their clinical mental health outcomes, by consumer type.

Number of people receiving care in specialised public mental health services who had <u>a significant deterioration</u> in their clinical mental health outcomes, by consumer type.

Denominator:

Number of specialised public mental health service episodes with completed clinical mental health outcome measures data, by consumer type.

Computation:

Expressed as a proportion: (Numerator ÷ Denominator)*100. Calculated separately by consumer type.

Data source/s

State and Territory data reported to NOCC and analysed by AMHOCN.

Data Quality Framework Dimensions

Institutional environment

Health Ministers adopted the routine measurement of consumer outcomes as a priority under the *National Mental Health Strategy (1992)* and in all subsequent National Mental Health Plans. It is also compatible with State and Territory governments' documented policy emphasis on high quality health services and increased consumer and carer participation.

The AMHOCN prepared this indicator using the NOCC data on HoNOS family of measures. The Australian Government (Department of Health) contracts AMHOCN to support the implementation of the NOCC as part of routine clinical practice by undertaking three functions 1) data bureau — receives and processes information 2) analysis and reporting — analyses and reports on the submitted data and 3) training and service development — supports training in the measures and their use for clinical practice, service management and development purposes.

The NOCC 1.50 was endorsed by all State and Territory governments in 2003, and all jurisdictions have reported data since 2004-05. The NOCC Technical Specification was revised to 1.60 in 2009. All jurisdictions have supplied, or resupplied NOCC data according to 1.60 from 2007-08. The NOCC protocol prescribes a set of standard measures to be collected at particular times (collection occasions) in the clinical process. Under the NOCC protocol, collection of outcomes data is mandatory at admission, review and discharge. Data collected outside of NOCC protocols are

excluded from the analysis.

Relevance

The scope of the NOCC is all specialised public mental health services managed by, or in receipt of funds from, state or territory health authorities Australian Government funded aged residential services are excluded.

The purpose of the NOCC is to measure consumer outcomes. This indicator relates only to consumer outcomes data collected through the HoNOS family of measures (HoNOS; HoNOS for Older People (HoNOS 65+) and HoNOS for Children and Adolescents (HoNOSCA). Other consumer outcome measures are also collected. For adults and older persons these include: Kessler 10 (K10+), Behavior and Symptom Identification Scales (BASIS-32), or Mental Health Inventory (MHI-38); for children and adolescents, the parent and youth versions of the SDQ. The uptake of these measures is not captured by this indicator.

Only episodes that have valid measures for two specified data collection occasions are included. 'Valid' measures are those with a correctly completed specified number of items, for the:

- HoNOS/HoNOS 65+ a minimum of 10 of the 12 items
- HoNOSCA a minimum of 11 of the first 13 items.

Brief ambulatory care episodes are excluded from this indicator.

The denominator for the 'completed inpatient' group excludes those episodes that were partially completed within the year and had a length of less than 3 days. The denominator for the 'completed ambulatory' group is made up of those episodes that started and finished within the year. The denominator for the 'ongoing ambulatory' group is made up of those ambulatory episodes that started within the reference year and were still open at 30 June or were open at the start and end of the reference year.

Outcome scores are classified based on effect size — a statistic used to assess the magnitude of a treatment effect. The effect size is the ratio of the difference between the pre- and post- scores to the standard deviation of the pre-score. Individual episodes are classified as 'significant improvement' if the effect size index is greater than or equal to positive 0.5; 'no change' if the index is between -0.5 and 0.5; and 'significant deterioration' if the effect size index is less than or equal to -0.5.

Outcomes are calculated for each of the following three consumer groups and the calculation varies depending on the setting and the duration of the episode of care:

- people discharged from hospital, episodes for people who were admitted and discharged from inpatient care during the reference period (an individual can have two episodes of care so the data represent episode-counts, rather than person-counts) — the admission and discharge occasions rated during the reference period are used
- people in ongoing community-based care, episodes for people who received community care for the whole of the reference period or who commenced community care sometime after 1 July (beginning of the period) and continued to receive care for the rest of the reference period — the first and last occasions rated during the reference period are used
- people discharged from community-based care, episodes for people who were discharged from community care (not including those discharged to hospital) and who received an episode of community care that started and ended in the reference period — the admission and discharge occasions rated during the reference period are used.

Outcomes are measured for consumers discharged from residential mental health care, but there were too few episodes with completed clinical mental health to derive outcome results.

A single 'average score' by consumer type does not reflect the complex service system in which services are delivered across multiple settings (inpatient, community and residential) and provided as both discrete, short term episodes of care and prolonged care over indefinite periods. The approach separates a consumer's care into segments (hospital versus the community) rather than tracking the person's overall outcomes across treatment settings. In addition, consumers' outcomes are measured from the clinician's perspective and not as the 'lived experience' from the consumer's viewpoint.

Data are not available for Victoria for 2011-12 and 2012-13. All Australian totals for 2011-12 and 2012-13 exclude Victoria.

Tasmanian data for 2009-10 are considered unreliable and not reported. As a result, 2008-09 data are used in the calculation of the 2009-10 Australian coverage estimates.

Timeliness

State and territory health authorities provide the NOCC data to AMHOCN for national collation on an quarterly/annual basis and all data are to be submitted approximately six months after the reference period.

The latest reference period for this data set is 2013-14.

Accuracy

States and territories are primarily responsible for the quality of the NOCC data they provide. However, AMHOCN undertakes extensive validation. Validation is conducted in two stages: (1) The compliance stage, concerned with ensuring that the data file will load and is structurally compliant. A non-compliant file is rejected and a new file needs to be submitted. (2) The data validation stage, primarily concerned with identifying and explaining or fixing inconsistent, anomalous, and exceptional issues in relation to the NOCC protocol as well as flagging, including invalid domain values and/or, missing data.

The proportion of episodes for which 'valid' outcomes data are collected is less than 50 per cent of expected coverage. It is not known if the results for those for whom data are collected are representative of the consumer population.

Coherence

Data are available for 2007-08 to 2012-13. The comparability of the outcomes data across jurisdictions and years may be affected by the relatively low proportion of episodes for which 'valid' outcomes data are collected and the degree to which this proportion varies across jurisdictions and years.

The Australian totals for 2011-12 and 2012-13 are not comparable to other years as they exclude data for Victoria.

Accessibility

Data for this indicator are published in the National mental health reports: www.health.gov.au/internet/main/publishing.nsf/Content/mental-data and in the Key Performance Indicators for Australian Public Mental Health Services set (available at mhsa.aihw.gov.au/indicators/nkpi/).

NOCC data are available on the AMHOCN website amhocn.org/. The following on-line products are available:

- web decision support tool
- NOCC Standard Reports
- NOCC Volume and Percentage Clinical Ratings: Australia

Interpretability

Metadata information for the NOCC are published on the AMHOCN website amhocn.org/.

Further information to understand this indicator are available:

- in the Key Performance Indicators for Australian Public Mental Health Services, Third Edition
- from the Key Performance Indicators for Australian Public Mental Health Services (available at mhsa.aihw.gov.au/indicators/nkpi/).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Data are not provided for the latest reference period (2014-15). Further work is required to ensure availability of more timely data.
- There are differences in the relative proportions of 'matched pair' HoNOS/CA/65+ ratings.
 - NOCC completion rates for people discharged from hospital and people in ongoing community based care are approximately 85 per cent.
 - NOCC completion rates for people discharged from community based care, are lower, at approximately 65 per cent. This pattern has been stable over time and generally consistent for all consumer age groups and jurisdictions, with the exception of ACT where technical issues have not enabled linkage of admission and discharge ratings for this consumer group. It is likely that the overall lower completion rate for this consumer group arises when consumers are administratively discharged from care following a period of no active care in the preceding period.
