A SALTER database summary

by

Greg Watts

SALTER Working Paper No. 23

AUGUST 1994

SALTER working papers document work in progress on the development of the SALTER model of the world economy. They are made available to allow scrutiny of the work undertaken but should not be quoted without the permission of the author(s). Comments on the papers would be most welcome.

L11	National balance sheet	20

S1	Expenditure on gross domestic product (percentage of gross domestic product)	22
S2	Gross domestic product - incomes approach (percentage of gross domestic product)	22
S3	National income (percentage of national income)	24
S4	Disposal of national income (percentage of national income)	24
S5	National capital account (percentage of the value of the region's capital stock)	26
S6	Balance of payments (percentage of gross domestic product)	26
S7	Household disposable income (percentage of gross household income)	28
S8	Disposal of household income (percentage of household disposable income)	28
S9	Government receipts (percentage of government receipts)	30
S10	Government disbursements (percentage of government disbursements)	32
S11	National balance sheet (percentage of national assets)	32

APPENDIX B

The following 10 tables are repeated for each of the 16 SALTER regions in the order shown.

12	Cost structure
13	Cost structure share (percentage of total costs)
14	Sales structure - domestically produced commodities (basic values)
15	Sales structure share - domestically produced commodities (percentage of total sales of domestically produced commodities at basic values)
16	Sales structure - imported commodities (basic values)
17	Sales structure share - imported commodities (percentage of total sales of imported commodities at basic values)
18	Commodity tax rates on domestically produced commodities
19	Commodity tax rates on imported commodities
20	Imports (landed duty-free)
21	Non-margin exports (export tax inclusive)

The order of the 16 SALTER regions and the page number of table 12 for each region is as follows:

Australia	36
New Zealand	48
Canada	60
United States	72
Japan	84
Republic of Korea	96
European Community	108
Indonesia	120
Malaysia	132
Philippines	144
Singapore	156
Thailand	168
People's Republic of China	180
Hong Kong	192
Taiwan	204
Rest of the world	216

1 Introduction

The initial equilibrium data set for the SALTER model is constructed from basic input-output tables, along with macroeconomic and fiscal information for the different regions obtained from secondary data sources. In addition to region-specific information, international bilateral trade flow data are also necessary to specify the SALTER model's database (Jomini et al 1994).

Two facilities have been developed to summarise the SALTER model's database. The first facility reports a range of macroeconomic data for each of the 16 regions of the SALTER model. The second facility reports a range of sectoral level trade and input-output data. This paper discusses the procedures used to run the programs that create the summary tables produced by the two database summary facilities.

2 Macroeconomic data summary facility

The SALTER model's database contains a range of macroeconomic data that covers the national trade accounts, income, expenditure and assets and liability information for government and households for each of the 16 SALTER regions. The macroeconomic data summary facility, known as the Salter Multi-region National Account Tables (SMRNAT), produces the 22 tables shown in Appendix A that summarise the macroeconomic data. The first 11 tables list the actual macroeconomic data, the remaining 11 tables express the information from the first 11 tables as shares of some relevant variable. The 11 tables are presented under the following headings with the variables used in calculating the set of share tables (S1 to S11) listed in *italics* :

Table L1:	Expenditure on gross domestic product
	Table S1 : <i>percentage of gross domestic product</i>
Table L2:	Gross domestic product (incomes approach)
	Table S2 : <i>percentage of gross domestic product</i>
Table L3:	National income
	Table S3 : <i>percentage of national income</i>
Table L4:	Disposal of national income
	Table S4 : <i>percentage of national income</i>
Table L5:	National capital account
	Table S5 : <i>percentage of the value of the region's capital stock</i>

Table L6:	Balance of payments
	Table S6 : <i>percentage of gross domestic product</i>
Table L7:	Household disposable income
	Table S7 : <i>percentage of gross household income</i>
Table L8:	Disposal of household income
	Table S8 : <i>percentage of household disposable income</i>
Table L9:	Government receipts
	Table S9 : <i>percentage of government receipts</i>
Table L10:	Government disbursements
	Table S10 : <i>percentage of government disbursements</i>
Table L11:	National balance sheet
	Table S11 : <i>percentage of national assets</i>

The procedure to produce the Salter Multi-region National Account Tables involves three steps. The inputs necessary for these three steps are the database file the user wishes to examine, two stored input files (SMRNAT1.STI and SMRNAT2.STI) and the following two files:

- SMRNAT.TAB (a TABLO file from which an executable program can be generated using the GEMPACK software); and
- SMRNAT.XLM (an Windows Excel macro).

The three steps work through a process of converting the information stored in header array format on the SALTER database into text format that can be read by Microsoft Windows Excel and then placed into formatted tables in a spreadsheet file.

The first step in the procedure is to create the executable file from SMRNAT.TAB using the GEMPACK software program TABLO (Harrison and Pearson 1994). This is carried out using the stored input file SMRNAT1.STI as the input file to TABLO. To do this type in the command:

```
TABLO < SMRNAT1.STI
```

This is followed by running the batch file LTG which compiles and links the fortran code to produce the executable file. To do this type in the command:

```
LTG SMRNAT
```

The second step in the procedure is to create the comma-separated file, known as a CSV file, using the executable file created in the first step. This step can be

carried out using the stored input file SMRNAT2.STI as the input file to the executable file. This stored input file assumes that the SALTER database to be summarised is called S3NEW.DAT. To do this type in the command:

SMRNAT < SMRNAT2.STI

This will create the CSV file SMRNAT.CSV.

It is possible to run the SMRNAT program on any updated SALTER database, by running the program interactively rather than using the stored input file SMRNAT2.STI. This will require the user to type in the name of the database file they wish to examine when the program prompts the user for the name of the input data file. An alternative method to run the SMRNAT program on any updated SALTER database is to edit the stored input file SMRNAT2.STI by replacing S3NEW.DAT with the name of the updated database to be examined.

The third step in the procedure is to create the tables in a spreadsheet file using the macro file SMRNAT.XLM. The CSV file named SMRNAT.CSV created in the previous step is the input file required by this macro. Once the macro file has been opened in Microsoft Windows Excel it can be started by simultaneously holding down the CONTROL key and the letter E. The CSV file does not need to be opened since the macro will open the CSV file automatically.

The macro presents seven dialogue boxes. The first three dialogue boxes explain the process to be followed, but do not require any input from the user other than to click the OK button on the dialogue box. The fourth dialogue box reminds the user that the CSV file created in the previous step must be in the same sub-directory as the macro. If the CSV file is not in the same sub-directory as the macro, then click the CANCEL button and the macro will end. If the CSV file is in the same sub-directory then click the OK button.

The remaining dialogue boxes require the user to answer questions relating to the names of various files. The fifth dialogue box prompts the user for the name that the spreadsheet file will be given. This must be a valid filename of up to eight characters followed by a .XLS extension. It is not necessary to enter the directory path for this file, since the macro will assume that the spreadsheet file will be in the same directory as the macro. If the user does not enter a filename with a .XLS extension, the macro will terminate with an error and will need to be started from the beginning. If the filename chosen is the same as a file that already exists, then the user will be given an opportunity to either click the CANCEL button and the macro will end, or click the OK button to overwrite the existing file.

The sixth dialogue box prompts the user for the name of the CSV file to use as the input to the macro, which will be the file SMRNAT.CSV unless the user has

renamed the input file created in step 2. Since SMRNAT.CSV is the default answer in this dialogue box, click the OK button to continue unless the CSV input filename has been changed. The final dialogue box prompts the user for the name of the database file from which the CSV file was created. This should be the file S3NEW.DAT unless the user has run the SMRNAT program interactively on a updated database. S3NEW.DAT is the default answer to this dialogue box and thus the user should click the OK button to continue if the standard database was used. The macro will then automatically create and format the tables and should be closed down without saving changes when it finishes.

3 Sectoral-level data summary facility

The SALTER database contains a range of costs and sales data for the 37 sector disaggregation for each of the 16 SALTER regions. In addition, the database contains sectoral bilateral trade data as well as sectoral border protection and commodity tax data for each region (Jomini et al 1994). This data summarised in 10 tables for each region are found in Appendix B. The 10 tables for each region are presented under the following headings:

Table 12:	Cost structure
Table 13:	Cost structure share (percentage of total costs)
Table 14:	Sales structure - domestically produced commodities (basic values)
Table 15:	Sales structure share - domestically produced commodities (percentage of total sales of domestically produced commodities at basic values)
Table 16:	Sales structure - imported commodities (basic values)
Table 17:	Sales structure share - imported commodities (percentage of total sales of imported commodities at basic values)
Table 18:	Commodity tax rates on domestically produced commodities
Table 19:	Commodity tax rates on imported commodities
Table 20:	Imports (landed duty-free values)
Table 21:	Non-margin exports (export tax inclusive values)

The procedure to produce the SALTER 37 level sectoral tables uses essentially the same three step procedure used to produce the Salter Multi-region National

Account Tables outlined previously. The inputs necessary for these three steps are the database file the user wishes to examine, two stored input files (SECTSUM1.STI and SECTSUM2.STI) and the following three files:

- SECTSUM.TAB (a TABLO file from which an executable program can be generated using the GEMPACK software);
- SECTSUM.XLM (a Windows Excel macro); and
- SECTSUM.XLS (a Windows Excel spreadsheet used as the template for the tables).

The first step in the procedure is to create the executable file from SECTSUM.TAB using the GEMPACK software program TABLO. This is carried out using the stored input file SECTSUM1.STI as the input file to TABLO. This is followed by running the batch file LTG which compiles and links the fortran code to produce the executable file.

The second step in the procedure is to create the comma-separated file, known as a CSV file, using the executable file created in the previous step. This step can be carried out using the stored input file SECTSUM2.STI as the input file to the executable file. This stored input file assumes that the SALTER database to be summarised is called S3NEW.DAT. This will create a CSV file named SECTSUM.CSV. As with the SMRNAT program, it is possible to run the SECTSUM program on any updated SALTER database, by either running the program interactively or editing the stored input file.

The third step in the procedure is to enter the data into the tables in the template spreadsheet file using the macro file SECTSUM.XLM. The CSV file named SECTSUM.CSV created in the previous step and the table template file SECTSUM.XLS are the input files required by this macro. Once the macro file has been opened in EXCEL it can be started by simultaneously holding down the CONTROL key and the letter E.

The macro presents seven dialogue boxes. The first three dialogue boxes explain the process to be followed, but do not require any input from the user other than to click the OK button on the dialogue box. The fourth dialogue box reminds the user that the CSV file created in the previous step and the template file must be in the same sub-directory as the macro. If these files are not in the same sub-directory as the macro, then click the CANCEL button and the macro will end, else click the OK button.

The remaining dialogue boxes require the user to answer questions relating to the names of various files. The fifth dialogue box prompts the user for the name that the spreadsheet file will be given. This must be a valid filename of up to

eight characters followed by an .XLS extension. If the user does not enter a filename with an .XLS extension, then the macro will terminate with an error, and will need to be started from the beginning. If the filename chosen is the same as a file that already exists, then the user will be given an opportunity to either click the CANCEL button and the macro will end, or click the OK button to overwrite the existing file.

The sixth dialogue box prompts the user for the name of the CSV file to use as the input to the macro, which will be the file SECTSUM.CSV unless the user has renamed the input file created in step 2. Since SECTSUM.CSV is the default answer in this dialogue box, click the OK button to continue unless the CSV input filename has been changed. The final dialogue box prompts the user for the name of the database file from which the CSV file was created. This should be the file S3NEW.DAT unless the user has run the SECTSUM program interactively on a updated database. S3NEW.DAT is the default answer to this dialogue box and thus the user should click the OK button to continue if the standard database was used. The macro will then automatically enter the data into the tables and should be closed down without saving changes when it finishes.
